These developmental approaches often emphasize a broader range of historical, political and even cultural factors than do market-based theories. Some, in particular, see a pattern of cumulative forces, in which the dynamics of the market lead to even greater concentration of productive forces at the centre. Availability of large markets, of economies of scale, of sophisticated specialized services, of a highly skilled labour pool, and like circumstances all attract capital and labour from peripheral regions. Consequently, these regions lose many of their most dynamic citizens and are able to offer fewer advantages to new investors. Cumulative growth at the centre, in this view, can thus lead to cumulative decline elsewhere. Regional policies seek to counter these forces.

Canada has employed some form of regional development policy throughout its history. Much of development policy aimed at sectors has had a strong regional basis where sectors have been concentrated in one or a few regions. In the oil and gas, auto, fisheries and timber sectors, for examples, a substantial portion of activity has been concentrated in a few regions. At the turn of this century, the federal government imposed export duties on uprocessed logs to increase the extent of processing in central Canada and British Columbia. During the Great Depression, relief measures were targeted regionally; the Prairie Farm Rehabilitation Act is a well-known example. Moreover, national development policies, such as those to enable or promote the movement of goods and services across the country have proved beneficial to the regions. The building and extending of our great national railways and highways fall in this category. Indeed, these implicitly regional policies have undoubtedly been more vital to regional development, broadly defined, than have the explicitly regional development programs of the Department of Regional Economic Expansion (DREE) and other comparable agencies.

Explicit regional efforts, however, had little part in federal economic policy immediately after the Second World War. Instead, emphasis was placed on promoting aggregate economic growth and stability, and on creating the outlines of the modern welfare state. The federal government expected that poorer regions, to the extent that they entered the calculations at all, would benefit from the general economic prosperity: "Regional development was seen as natural adjunct of national development."[4] By contrast, from the close of the Second World War, Britain used regional policy as a pillar of its post-war full-employment policy.

In Canada, the first explicit policies to be aimed at decreasing regional economic disparities were developed in the wake of the 1957 report of the Royal Commission on Canada's Economic Prospects (the Gordon Commission). Sustained national economic growth, the Commission and supporting research studies found, had not eliminated regional disparities. Political action soon followed in the form of Prime Minister Diefenbaker's announcement of the "Roads to Resources" program. In addition, the federal government introduced winter-works bonuses to support construction activity undertaken in times and areas of relatively high unemployment.

The Agricultural Rehabilitation and Development Act (ARDA) of 1961 introduced a long succession of boards, agencies, committees and departments. The target was rural poverty. The goal was to find ways to keep marginal farmers on the land through better techniques of land use. A more explicitly regional (as compared with sectoral) focus for development efforts came in 1962 with the creation of the Atlantic Development Board (ADB), although at the time, the new board was assigned only a research and advisory role.

Regional development took on added importance with the change in government that took place in 1963. In that year, the new government of Lester Pearson gave the ADB a program orientation and funds to disburse, most of which subsequently went toward social infrastructure projects. In 1964, ARDA became the Agricultural and Rural Development Act, and a new department, Forestry and Rural Development, assumed responsibility for its application. ARDA's focus changed from purely agricultural assistance to more general rural economic development. The new department designated Special Rural Development Areas for attention. The Fund for Rural Economic Development (FRED), established in 1966, had an even broader mandate: it was to implement comprehensive rural development strategies in locations judged to be "promising". Areas which did not meet the criteria were to receive adjustment aid; out-migration was deemed inevitable, and the only task was to make this process as painless as possible.

Not only rural areas received government attention. The federal government introduced the Area Development Agency (ADA) in 1963, to promote industrial development in poorer regions. Firms locating in designated areas could qualify for tax exemptions, for accelerated depreciation allowances and, with the introduction of the Area Development Incentives Act in 1965, for cash grants.

These early regional development efforts were scattered throughout the federal bureaucracy, each with different and sometimes tenuous links to the provincial governments concerned. In 1969, with the establishment of the Department of Regional Economic Expansion, consolidation of regional programs took place. Regional economic development was now to have a departmental focus; the new portfolio:

> *... was not to be just another line department but rather was to initiate and facilitate cooperative efforts between the line departments, when so authorized to coordinate the implementation of programs and, when necessary, to proceed on its own.*[5]

The appointment of a senior minister to the portfolio emphasized the importance to be attached to the task.

DREE continued to use many of the same policy instruments as its predecessors and also introduced new approaches partly because industrial assistance was added to its responsibilities. It designated certain urban centres in poorer provinces as "Special Areas", thereby making them eligible to receive funds that would support the provision of social infrastructure. These towns and cities were to be the "nodes" or "growth poles" around which economic development would centre and spin off throughout the region. Under the Regional Development Incentives Act (RDIA) the practice continued of designating certain areas as eligible to receive loan guarantees and subsidies for firms choosing to locate in them.

The initial enthusiasm that greeted DREE soon disappeared. Observers criticized the department on two grounds. First, its very policies became suspect. It soon gained the reputation of dispensing large sums of money with negligible results. The industrial incentives grants, in particular, attracted severe criticism. Some critics charged that these grants did not noticeably affect firms' locational decisions; that even when they did, such decisions involved only reallocation of economic activity from one underdeveloped region to another; and that the incentives DREE offered created significant and costly distortions. Even the infrastructure grants under the Special Areas program became targets, as "growth pole" theory fell into disfavour among planners.

The second major concern with DREE lay in its administrative approach. The department appeared to be too centralized and too inflexible, especially with respect to the economic development objectives of provincial governments. There was also considerable tension within the federal bureaucracy between DREE, with its explicit regional development mandate, and line departments, with their more sectoral approach. Often the latter – Transportation, Energy and Fisheries, for example – could affect a region's economy much more significantly than could any policy that DREE was able to mount with its limited funding.

As a result of these pressures, the federal government reorganized DREE in 1973, and instituted the system of General Development Agreements (GDAs). It negotiated with each province a separate agreement wherein the general developmental goals to be pursued were outlined. Committees of officials drawn from both orders of government devised specific projects that were to be run on a shared-cost basis by the province. DREE staff, including a senior Assistant Deputy Minister, were relocated to each of the regions, in order to provide more local expertise. In Newfoundland, the federal government paid for up to 90 per cent of project costs; it paid for 80 per cent of such costs in Nova Scotia and New Brunswick, 60 per cent in Quebec, Manitoba, and Saskatchewan, and 50 per cent in the three wealthiest provinces. Prince Edward Island continued to be covered by an existing federal-provincial development agreement. This DREE procedure was a radical departure from earlier forms of federal-provincial consultation on economic development.

The federal government's approach to regional economic development also changed. The emphasis on growth centres was abandoned. Projects were organized on a smaller scale, but were to encompass a wider range of sectors and to be distributed thoughout any given province. The province, more than a particular region, became the relevant planning unit, and "the focus on provinces meant that regional development policy was really provincial development policy".[6] It was during this period, too, that regionally differentiated investment- and employment-tax credits and Unemployment Insurance benefits were introduced.

Members of both the federal and the provincial governments soon began to criticize the GDA approach. Some provincial governments wanted even more control over program implementation, although most viewed the GDA period favourably, especially as compared to the arrangements that had preceded it and that were to follow. During the course of this Commission's hearings, we Commissioners heard a number of expressions of provincial support for the GDA approach. The real difficulties with GDAs were on the federal side. Ministers of line departments wanted more influence over DREE programs. They saw DREE as tied too closely to provincial priorities. As a result of these bureaucratic tensions, the intended provincial and federal co-ordination and integration of regionally sensitive policies encountered difficulties. Another ground for criticism was found: federal politicians considered that they were not receiving enough political credit for programs that were federally funded, sometimes to the level of 90 per cent. Provinces, however, were in a better position than the national government to represent themselves as the source of the largesse, and often took advantage of this opportunity.

A sometimes-bewildering succession of administrative reorganizations followed. In 1982, responsibility for regional economic development shifted from a particular department to economic ministries as a whole: "The regional perspective [was to] be brought to bear on the work of all economic development departments and in all economic decision making by the Cabinet."[7]

As part of the necessary reorganization, DREE's regional programs were combined with the industry and small-business interests of the Department of Industry, Trade and Commerce (ITC) to form a new Department of Regional

Industrial Expansion (DRIE). Both DREE and ITC were disbanded as separate departments. The Cabinet Committee on Economic Development became the Cabinet Committee on Economic and Regional Development, and the Ministry of State for Economic Development became the Ministry of State for Economic and Regional Development (MSERD). A number of other changes were made, including the appointment of senior Federal Economic Development Co-ordinators (FEDCs) for each province. The merging of regional development considerations with those of more general economic development policies was now complete, at least for administrative purposes. In the process, concern shifted from "regional development" in the sense, primarily, of development of slow growth areas, to "regional development" as the need to focus on economic development in each province.

The basic instrument of economic planning under this system was the Economic and Regional Development Agreement (ERDA), which the federal government was to sign with each province. As with the GDAs of an earlier period, these agreements were to be the overall planning documents within which specific policies and projects would be developed. Within this accepted framework, however, the emphasis would be focused on each government's direct delivery of its own programs, to allow the federal government its proper political due. Federal economic effort in a province and its links with provincial economic interests would be more fully co-ordinated through the FEDCs. Little in the ERDAs was original, and its projects turned out to be very similar to those of the GDAs.

Still further changes were in store. In June 1984, MSERD was disbanded. Responsibility for regional economic development was assigned to a single Minister of State for Regional Development operating under DRIE. In September 1985, even this position was abolished. Regional development policy is now the direct responsibility of the Minister of Regional Industrial Expansion.

Evaluation

How successful have been our regional development policies? To answer this question definitively would require an ability to compare the present state of economic development in those regions receiving assistance to its imagined state in the absence of such policies; unfortunately, such a task is impossible. Some research, however, has shed light on the effect of certain regional development policies.

Researchers have devoted most of their attention to RDIA grants, chiefly because they are the most visible and most contentious, even though industrial subsidies have represented only a small portion of total government spending on regional development. Initially, researchers tried to determine whether grants actually influenced the locational decisions of firms. A 1971 survey by the Atlantic Provinces Economic Council[8] (APEC) found that only 20 per cent of firms polled said that even without the grants, they would have located in the designated area. The other 80 per cent were presumably influenced by the grant to some degree, although the survey gives no indication as to whether the actual grants proved merely adequate or were unnecessarily generous. A DREE study completed in 1973 produced results similar to the APEC's.

In 1977, the Economic Council of Canada published a comprehensive study of regional economic development in which it attempted to evaluate the effectiveness of DREE grants. It compared unemployment, income and migration rates in the recipient regions before and after the inception of the grant program. It concluded that "job opportunities in the Atlantic region have improved over the last few years, although nothing much seems to have changed elsewhere."[9] Nevertheless, it is impossible to establish that DREE policies necessarily had anything to do with this outcome.

To meet this uncertainty, the Economic Council undertook its own study of the success of grants in influencing firms' location in the Atlantic provinces. It found that 25 per cent of DREE-supported establishments were definitely influenced by the grant program, and that another 34 per cent were possibly so influenced. Little evidence was found that the subsidies "crowded out" other economic activity in the region, and so the net gain remained at 25 per cent to 59 per cent. As a final step, the Council compared the increment to national output from DREE-created jobs with the cost of providing those jobs. Even with conservative estimates of the grant's effectiveness in determining plant location, the program appeared to be successful. The additional contribution to national output from workers who would otherwise have been unemployed, more than covered the cost of the funds used.

The Economic Council's overall evaluation of the industrial subsidy program was cautiously optimistic:

> *Our own assessment of previous evidence, together with our analysis of data on the births and deaths of establishments in one region only (the Atlantic), has led us to the view that the subsidy program is far less successful than published estimates of job creation would imply. To that extent, the critics are right. But the subsidies, nevertheless, seem successful enough to be a paying proposition. The value of the jobs created appears to outweigh the inefficiency involved in locating production inappropriately.*[10]

The Council was unable to come to any definite conclusion on the other components of regional development policy, such as the infrastructure grants.

Other writers have been more critical of the DREE programs. One, for instance, concluded that:

> *In the current situation, the publicly-recognized RDIA goal is employment in certain depressed regions . . . DREE fails to achieve the greatest number of new jobs, and incurs a higher cost per new job created, by continuing with the subsidies which are inconsistent with their goals.*[11]

The specific complaint, based on rigorous statistical analyses of the program and its effects, was its bias towards capital-intensive production techniques. Another analyst was even more sweeping in the criticisms put foward:

> *In view of all the uncertainties inherent in the subsidization of firms – the absence of solid evidence that investment in the designated regions is really increased, the even greater doubt about employment, the effects on distribution*

> *of income among persons, the possibility of inequity in the government's dealings with firms, the probable reduction in national income in Canada as a whole, and the lack of any real assurance that modernization and progress are fostered in the designated regions – I wonder if it might not be best for the federal government to restrict its subsidy program to the support of poor people . . . and to such transfers to provinces as are agreed upon in federal-provincial negotiations, and to keep its distance from firms' decisions about the location of investment.*[12]

A research paper prepared for this Commission, summarized the available evidence on regional development initiatives:

> *Despite widely varying policy thrusts and economic circumstances, there has been little improvement in the relative position of most of the poorer provinces as measured by income net of transfers . . . It seems reasonable to conclude that there has been no discernible progress with regard to regional development. This finding alone would appear to be a serious indictment of the many policy efforts, and very large public sector outlays that, it was argued, could achieve that goal.*[13]

Nevertheless, as Commissioners have noted, it may be that the policies have prevented regional imbalances from getting worse. Nor has it been shown conclusively that if Canada had devoted greater resources to regional development, more progress would have been made.

Criticisms of regional development efforts have gone well beyond arguing that they are simply ineffective. A much discussed and controversial view partially attributes continuing regional economic disparities to the design of these transfers.[14] Economic circumstances create excess aggregate supply in a region. Wages and prices fail to adjust properly, with the result that unemployment triggers transfer payments of various kinds into the region, including individual compensation to the unemployed and additional equalization entitlements to the host provincial government. The receipt of these transfers blocks further adjustment in the form of out-migration or falling real wages. Without such adjustment the region is forever unable to regain its former economic standing, for its wage rates remain out of line relative to its labour productivity.

Transfers have been associated with some of the least suitable of the provincial economic policies.[15] The argument rests, essentially, on what is known as moral hazard. If provincial governments are not forced to bear the full costs of their actions, they will implement policies, highly attractive on some grounds, perhaps, which they would otherwise avoid. Unrealistic minimum-wage laws, language policies and restrictions on non-resident land ownership are three examples cited. These popular programs can be implemented because the distortions they cause are paid for, at least in part, by others. For example, Unemployment Insurance covers those persons who are displaced by minimum-wage legislation, while equalization payments offset some of the adverse economic consequences resulting from the other two examples cited.

This system results in a state that observers refer to as "transfer dependency". It creates a vicious circle in which economic misfortune begets transfers which, in turn, father poor economic policies which beget further economic misfortune. All private, as well as government, economic agents in the recipient regions are acting rationally within the existing system of incentives, yet the outcome is continued economic stagnation. This situation causes increasing expense to the economic union as a whole.

Whatever the merits of this argument in principle, it is still subject to empirical assessment. Some evidence exists to support certain aspects of the thesis, but to date, no complete assessment has been made. Work on unemployment-insurance and labour-market adjustments[16] tends to support the notion that transfers do affect interprovincial migration. More than one analysis has concluded that the 1971 changes to the unemployment insurance scheme, which made it significantly more generous, acted to retard out-migration from the Atlantic provinces.[17] These studies suggested that this migration, given the relative income and unemployment levels of the source and probable destination areas, would be socially beneficial. Attention has also been drawn to research suggesting that:

> *The UI program reinforces the concentration of unstable and short term jobs in the regions with high unemployment and a high concentration of seasonal industries.*[18]

Commissioners note that such criticisms are directed at impediments to effective adjustment processes. They do not address the effectiveness of policies to improve the economic base of disadvantaged regions.

These debates centre on the uncertainties involved in developing regional development policies. The uncertainties operate at a number of levels. One policy choice must take into consideration aggregate national income growth and the growth of each particular province or region. The central concern here is whether measures to promote the latter reduce the former by diverting resources to areas of lower reward; or, conversely, whether in the long run, regional development programs contribute to the growth of the national economy. Commissioners' recommendations seek to minimize this dilemma by emphasizing that regional development policy should focus as much as possible on improving the productive capacity of poorer regions.

A choice must also be made between "compensatory" policies designed to minimize the gap between earned and total incomes, and those policies which are developmental, or which promote adjustment. "Compensation" is designed to soften the effect of market forces on individuals. In Part V of this Report, however, Commissioners have recommended redesigning Canada's social policies to enhance Canadians' concept of social justice while reducing the barriers to adjustment. These recommendations, if put into practice, will have important regional effects. We have shown, too in this chapter, that equalization, a compensation program, also has important positive implications for efficiency.

In addition, tension exists between interregional market-adjustment policies, which are aimed primarily at facilitating the mobility of labour and capital to areas of their greatest productivity, and developmental policies, which are aimed at improving the productive capacity of individual regions. We Canadians, Commissioners believe, have decided that policies must be blended in order to make it possible for those who wish to move to do so; but the economic and social viability of all our regions must be promoted as well.

These policy decisions have been reflected in administrative tensions. As our analysis suggests, Canadians have never settled on a stable blending of policies in this area. We have moved from a sectoral orientation, under ARDA, to a more generally directed economic development approach, including adjustment out of the region, FRED, to a strategy of creating growth poles, under ADA and DREE. Specific policies have ranged from adjustment assistance to infrastructure grants, to tax breaks, to direct subsidies, to regionally differentiated investment and employment credits.

Nor have we Canadians settled on the proper relation between federal and provincial responsibilities for encouraging and supporting regional economic development. Early federal efforts were highly centralized and tended to ignore provincial wishes. During the GDA period, however, the reverse was true: the federal government financially supported province building. The pendulum then swung briefly in the opposite direction.

The federal government has been unable to form a satisfactory link between its regional development responsibilities and its broader role in managing our national economy. The most obvious manifestation of this failure is apparent in the constant rearrangment of the federal bureaucracy, first, to bring regional interests into a separate department, then to encourage all departments to consider regional implications, and finally, to drift back to the single-ministry concept. We are thus faced with three questions: What is the appropriate division of labour between the federal and provincial governments? How should the Government of Canada balance its regional economic with its national responsibilities? What policies and programs should be pursued?

Conclusions

We Commissioners would not go so far as to label Canada's continuing regional economic disparity a crisis. We do, however, view it as a serious problem. The nature of individual Canadians' future economic prospects should not depend so significantly on their province or place of birth. Regional development must therefore remain one of Canada's primary policy goals. Commissioners are equally convinced, however, of Canadians' need to reconsider our view of regional economic disparity, our notions of what we should do to overcome it, and our ideas about the institutional mechanisms we should bring to the task. Some of the propositions Commissioners advance are principles we are urging Canadians to accept, some are statements of economic constraints that Canadians have no choice but to accept, and some are conclusions drawn from our research and hearings. Together they form a package that we hope will serve to guide regional policy formation in the years to come. The proposals are designed to be consistent with this Report's broad themes concerning principles both of economic adjustment and of federalism.

Our first proposal concerns the concept of regional disparity. In our opinion it is time to stop viewing inequalities simply in terms of per capita income differences. Transfers, both to individuals and governments, have rendered this focus unnecessary. Individual Canadians now have a variety of support mechanisms to fall back on in the event of personal hardship, and our proposals in Part V, especially those concerning the new Universal Income Support Program (UISP) and the Transitional Adjustment Assistance Program (TAAP), if adopted, will further improve this situation. Our equalization scheme, imperfect as it is in some respects, would allow each provincial government the means to provide its residents with a comparable level of public goods and services, without imposing the burden of unduly high taxation rates. There is, in fact, less variation in per capita incomes across regions now than there is among individuals within provinces. To the extent that Canadians are truly concerned with income inequality, our first priority should be the vertical dimension of the problem, that is, its application to individuals.

The core factors of regional inequality are wage differences for given types of employment, and variations in employment rates. A job is important, first and most obviously, because it provides a source of income. But it offers more than that. In a society such as ours, a steady job also provides a sense of self-worth and dignity that the most generous transfer scheme could never duplicate. In a federal state, there is even more at stake. The availability of jobs in a region also provides the population base necessary for the survival of that community.

Commissioners conclude that Canada's past policies have compensated quite adequately for regional economic disparities, but that they have been markedly unsuccessful in promoting self-sustaining economic development. The complex mix of transfer programs has substantially evened out per capita incomes across regions, but it has not provided the foundation for robust future economic development.

Commissioners also find some merit in the thesis that Canadians' difficulty in establishing acceptable employment rates in some parts of the country lies partly in the distortions created by a variety of well-intentioned, but misguided, economic policies. Canadians' concern with compensating regions for their economic shortcomings has been partially responsible for those regions' maintaining this status. We have neglected to structure policies and programs to provide the proper incentives to firms, workers and governments. A cycle of transfer dependency has been created whereby economic disparity begets compensation which, in turn, induces behaviour that sustains economic disparity. To make this point perfectly clear, Commissioners are not suggesting that transfer dependency explains all regional economic disparity. There were, after all, significant disparities of this sort in the decades before the 1950s, when few such transfer programs existed. We are simply suggesting that inappropriate incentives are part of the explanation of some of the present problems in this field.

Commissioners believe that regional economic well-being is the responsibility of all levels of government, including municipal government. The role of provinces and municipalities is clear. The justification for including the federal government lies in Canadians' concept of what it means to be a citizen of this country and the practical need to integrate regional development with national development.

We come now to an important economic constraint which relates directly to the institutional design issue. There is typically, but not always, a fundamental conflict between the goals of regional economic development and those of national efficiency. The location of economic activity is normally not neutral. For a variety of complex reasons, some regions of Canada are simply better situated than others to support internationally competitive enterprises. Furthermore, as this analysis of our economic union has shown, the fewer the barriers to interprovincial trade flows, the more efficient is our national economy and the greater the ease with which capital and labour can be reallocated interregionally. Yet distortions in these markets are often the product of otherwise defensible efforts by both federal and provincial governments to encourage economic development in Canada's poorer regions.

A political constraint accompanies this economic one. The clashing of goals often means that regional economic development produces political tension which operates at two separate levels. The federal public service itself is torn between departments with a national and a sectoral focus, and those with a more explicit regional mandate. Added to this tension is the unavoidable federal-provincial conflict. Whenever the national government undertakes economic policies that are designed for a specific place, as regional development measures are by definition, it impinges on provincial government plans.

In the recommendations set forth in this Report, Commissioners focus both on the federal government's regional development policy, and on that government's implementation of its policy. As we noted above, the federal government has a legitimate role to play in regional development, but its involvement in this policy sphere has typically conflicted with its overall national responsibilities. Thus a further requirement emerges: whatever the federal government does in this field should not be inconsistent with provincial plans. This position is consistent with the basic principles of federalism, but it does not imply that the federal government must blindly support whatever development strategies the provinces put forward.

Does this complex of constraints leave any scope for federal initiative? We Commissioners believe that it does. We return to the two areas of disparity that we find important, wages and employment rates to define the proper federal role. Wage gaps are created because labour productivity for given types of employment is not equal across regions. If output per worker in poorer regions could be brought up to the level that exists in wealthier ones, one important source of regional differences would be removed. The same statement holds true for employment-rate differences: if any Canadian, irrespective of region, had an equal chance of obtaining permanent employment, the other main source of regional disparity would disappear.

The form that the Government of Canada's involvement in regional economic development should take follows logically from these observations. Our national government's responsibility should be to work to remove differences in labour productivity across regions and any factors that impair the efficient operation of regional labour markets. If poorer regions adopt technology more slowly, the federal government might help to accelerate this process. If labour skills are deficient, it could help to provide retraining. If there are structural problems in matching labour skills with employment demands, it could establish information centres.

This proposal is an extension of the argument advanced in Part III of this Report. There the object in seeking government action was to correct for market failures of whatever origin. Intervention was seen as economically efficient or socially beneficial if Canadian firms were experiencing problems in adopting the latest technology or in reallocating capital and labour from "sunset" to "sunrise" industries or in improving the competitive position of groups in the labour force that historically have been unable to compete on equal terms. The private market-place fails in these instances when it does not generate the socially most desirable outcome.

Commissioners have simply added to this analysis another dimension that is inherent in regional disparities. Specifically, we would assert that the market has failed if it has not provided comparable firms in all regions of the country with equal access to capital, technology, and labour and management skills. In Part III, we asked whether private actors would bring the latest technology to Canadian industry at rates that would allow Canada to compete in the international market-place. If the answer was no, then an industrial strategy of some sort seemed justified. Here we ask whether these same agents will also diffuse this same technology adequately to all regions of the country. If not, then regional policies seem warranted.

These policies would not attempt to bring the same industrial or occupational structure to each regional economy. The object would simply be to ensure that industries that do locate naturally in poorer regions can produce as efficiently as their counterparts elsewhere. A brewery or government office in Atlantic Canada, for example, should be no less productive than its counterpart in Ontario. Almost certainly, however, there would continue to be a greater concentration of high-technology industries in the latter province.

A similar analogy applies to employment differentials. Commissioners are concerned about unemployment at the national level and seek policies to reduce it because we do not believe that the labour market is sufficiently responsive to effect this on its own. In Canada, however, as we noted above, unemployment has a marked regional dimension as well. The national unemployment figure is an average of consistently higher jobless rates in some provinces and consistently lower rates in others. Moreover, these differences tend to widen as aggregate unemployment rises and to narrow as it falls.

The inference to be drawn from the first observation is that all regional labour markets are not equally efficient at matching jobs and workers to meet given levels of aggregate demand. That the gap widens as national economic activity slows is evidence that changes in aggregate demand do not spread evenly to all regions. In both instances, markets fail in the sense that they do not operate equally effectively across the country. As with differences in productivity, then, this failure establishes the rationale for the federal government's regional policy.

It is considerably easier to establish that something should be done about differences in employment rates than it is to recommend exactly what to do. In part, the differences will disappear naturally, with elimination of productivity gaps and equalization of wage levels for given types of employment. As long-term equilibrium is established, there will be less out-migration of younger and more highly educated workers. Participation rates will also rise as the economic outlook improves. These two effects together will raise to the national average, the ratio of those seeking work to total provincial population eliminating part of the difference in employment rates.

The difficulty for policy purposes is compounded by the third component of differences in employment rates: unemployment rates that are much higher in poorer regions. It is important to be realistic on this point. There is absolutely no guarantee that as productivity levels, and hence wage rates, rise toward the national level, there will be enough jobs generated in the poorer regions to employ fully the existing labour force. Let us examine what underlies these possibilities. Suppose that federal and provincial governments raise labour productivity in poorer regions. Their action will have two distinct effects. First, a region will need less labour to produce any given level of output. Secondly, costs may fall for those products that the region produces in competition with suppliers elsewhere, suggesting that total output could increase. The net effect is uncertain. If the labour-saving bias in productivity improvement is strong and the scope for capturing new markets weak, net job destruction will result. The converse will occur under reverse conditions. To date, there is simply no firm evidence about the balance of these alternative outcomes in the different regions of Canada.[19]

It is at this point that Commissioners introduce a sharp distinction between federal and provincial functions in regional economic development. The federal government, we wish to suggest, should not involve itself directly in regional job creation. Its responsibilities end with its commitment to overcome regional productivity gaps and labour-market imperfections. It has served regional equality if identical employments fetch roughly similar compensations, and if adjustment to change in labour markets proceeds equally efficiently in all regions. In addition, the federal government should bring to discussions of regional development a direct concern with building complementary and mutually beneficial links among provincial economies. In other words, it should set regional policy in a national framework.

Provincial governments and their electorates typically want more than this from economic policies. Specifically, they have absolute employment targets as well. They wish generally that all current and future residents will be able to find suitable employment locally. This emphasis on place prosperity is both understandable and defensible when it comes from a provincial government. It should not, however, unduly concern the federal government. Commissioners believe that community preservation, to the extent that people want it, is ultimately the responsibility of citizens and of their local and provincial governments. The federal government must not stand in the way of achieving that goal, in the sense that its economic and social policies must not consistently discriminate against particular groups, but neither need it devote resources directly to meet that goal. Provinces, however, must have access to such funds and be free to use them in this manner if they so desire. The following conclusions form the basis of our recommendations:

- In the interests of the efficiency of the national economy and of promoting interregional adjustment, the federal government should modify certain regionally distorting programs, in directions consistent with the analysis presented in Part III of this Report.
- The federal government should direct regional development programs toward improving regional productivity and the efficiency of the labour market.
- Provinces should take full responsibility for place-specific employment measures as part of their own regional development policies. In order to increase their capacity to address local needs, provinces receiving equalization payments should also receive Regional Economic Development Grants from the federal government.
- Co-ordination of these federal and provincial activities should take place through continuation of the mechanism of Economic and Regional Development Agreements.
- A sustained federal commitment to regional development requires that a single central agency be responsible for injecting regional concerns into the programs of individual federal departments and for co-ordinating federal efforts.
- Commissioners believe that the total federal financial commitment to regional development, which would combine the Regional Economic Development Grants with funds spent through ERDAs, should increase significantly over the next few years.

Federal-Provincial Fiscal Arrangements

Fiscal arrangements are at least as important an institution of the federation as the machinery of intergovernmental relations. Like other countries with federal systems of government, Canada has departed a long way from the fiscal equivalent of watertight compartments, where each government carries out its taxing and spending decisions independently. In Canada, both orders of government exploit the major sources of taxation; tax changes by one order will therefore have immediate consequences for the other. Moreover, revenues flow between governments in massive amounts; attempts by the federal government to constrain expenditures are difficult when a quarter of its spending is in the form of transfers to the provinces; the same is true of provinces with respect to municipalities.

Taxation has a long and complex history in Canada, and fiscal arrangements have been a constant preoccupation of federal-provincial relations since 1867. The British North America Act gave the federal government unlimited taxing authority, while it restricted the provinces to direct levies. Since this meant that the lucrative customs duties and excise taxes of the day were removed from the provinces, the federal government agreed to make specified annual payments in "full and final settlement" of all claims on it. Under these arrangements, the provinces collected only 27 per cent of their total revenues in the first years of Confederation. Their taxation effort, including initial forays into direct taxation of income, increased gradually in the late nineteenth century and again after the First World War as their expenditure responsibilities grew. The federal government also began to levy income taxes during the First World War. Nevertheless, by the time of the onset of the Great Depression, provincial and local authorities were collecting over 70 per cent of Canadian public revenues.

The scramble for revenues in the 1930s led to a "tax jungle" of double-taxation and conflicting regulations. The overall structure of federal-provincial finance was extensively examined in the historic work of the Royal Commission on Dominion-Provincial Relations, the Rowell-Sirois Commission. The Commission recommended that the federal government collect all personal and corporate income tax and death duties, and remit funds to the provinces, but this recommendation met stiff resistance from the provinces. However, the Second World War brought about what a Royal Commission's recommendations could not. The federal government took over these tax sources for the duration of the war and, in exchange, made specified grants to the provinces under the Tax Rental Agreements. By most accounts, this was the high point of centralization in the Canadian tax system, just as the half decade leading up to the Depression had been the high point of decentralization.

The Tax Rental Agreements continued after the war, although with significant modifications in scope and structure, including the withdrawal of Quebec and the partial withdrawal of Ontario in 1947. Renewed in 1952, the first major change in the agreements came in 1957, when provinces were given a choice: they could continue to "rent out" the direct taxation field to the federal government; or they could levy their own income taxes and succession duties, and have the government in Ottawa provide an offsetting "abatement" of federal tax payable. At the same time, fiscal equalization payments were explicitly introduced for provinces where income tax and succession duties yielded less than an Ontario-B.C. average. In a subsequent series of federal-provincial negotiations, the abatement of federal taxes was steadily increased to provide more "tax room" to the provinces. The federal personal income-tax abatement, originally set at 10 per cent of the federal tax payable, rose to 28 per cent by 1967. In 1962, in a further legal change, provinces were required to impose their own corporate and personal income taxes. However, the federal government would continue to collect provincial taxes free of charge as long as they conformed with federal rules under provisions of tax collection agreements. Otherwise, the provinces were free to establish and administer their own systems, which Quebec did for both corporate and personal income taxes, and which Ontario did for corporate income taxes.

Through these successive arrangements, wartime fiscal centralization was dramatically changed. If we look only at revenues raised by each level of government from its sources, the federal share declined from 73.9 per cent of the total in 1945, to 67.1 per cent in 1955, and to 43.3 per cent by 1983. The provincial and local share rose in the same years from 26.1 per cent to 32.9 per cent, to 56.7 per cent. At the same time, intergovernmental grants increased, making the shift even more dramatic. After transfers are accounted for, federal revenues dropped from 69.2 per cent of the total in 1945, to 32.6 per cent in 1983, and the provincial and local share rose from 30.8 per cent to 67.4 per cent.[1] The broader historical pattern, expressed in terms of gross national product (GNP), is shown in Table 22-12.

There are other indicators of relative decentralization and increasing flexibility. From the inception of the Tax Collection Agreements, provinces were free to fix their tax rates above or below the amount of the federal abatements. Their flexibility was enhanced later, when abatements ceased for personal income taxes. The provinces were to introduce various tax credits against provincial tax payable, thus increasing their autonomy and flexibility. These changes also led, especially in the 1970s, to increased diversification in provincial tax rates. In 1985, provincial personal income-tax rates as a percentage of the federal tax ranged from a high of 60 per cent in Newfoundland to a low of 43.3 per cent in Alberta and 43 per cent in the Northwest Territories. Provinces also gained more flexibility with respect to the grants they received from the federal government. A larger proportion of federal grants took the form of either unconditional payments (equalization) or block grants with few and broad conditions.

Intergovernmental transfers also increased: as a proportion of federal expenditure, they rose between 1945 and 1983 from less than 4 per cent to more than 18 per cent. Each government levies its own taxes, but only the federal government raises its entire revenue, excluding borrowing, of course, through taxation. The others – provinces, local authorities, and hospital boards – rely, to varying degrees, on transfers from other governments. In 1983, for example, the federal government received slightly more than $70 billion in revenue and transferred nearly $17.5 billion. In other words, for

every three dollars the federal government collected in taxes for its own use that year, it collected an additional one for the sole purpose of turning it over to another political authority, most of these funds went to provincial treasurers.[2]

By far the largest category of transfers are federal contributions to health, education and welfare programs. In 1983–84, over $11 billion, or just over 60 per cent of the cash transfers, are accounted for in this manner: $7.6 billion under Established Programs Financing, $3.1 billion for the federal share of Canada Assistance Plan payments, $70 million for other health and welfare, and $182 million for bilingualism in education. The other large category is general purpose transfers of unconditional – principally equalization – entitlements, which total nearly $5.5 billion or about one-third of the total cash transfers. Miscellaneous transfers such as payments to municipalities and territories account for the remainder.[3] These payments are summarized in Table 22-13. Table 22-14 summarizes payments for previous years.

The more than $17 billion the provinces received as cash transfers in 1983 represented a fifth of the total funds at their disposal that year, a drop from just over a quarter in 1975.[4] The provinces, in turn, remitted one-third of their total revenue – $27.8 billion – to local governments and school and hospital boards. On a net basis, the provinces paid out over $10 billion more than they received. In effect, they financed their entire expenditure on goods and services from their own revenues or, in some instances, by borrowing. Local governments, by contrast, raised only about half of their total revenues

themselves, and hospital boards only about 5 per cent. These latter jurisdictions are the main net recipients in the intergovernmental transfer system which is in place today.[5]

Table 22-15 shows the historical evolution of these intergovernmental transfers. The proportion of the federal budget committed to such transfers has generally increased, and provincial dependence on them has been fairly constant. There has been a decline in both of these dimensions, however, in the last few years.

As Table 22-16 illustrates, provinces vary greatly in their dependence on federal transfers. In 1980–81, all four Atlantic provinces met almost half their revenue needs from federal sources, though this proportion dropped somewhat by 1984–85. Similarly, Manitoba's proportion declined, from 38 to 30 per cent. Quebec received almost a quarter of its revenues from the Government of Canada. Ontario, Saskatchewan and British Columbia each received about 17 per cent from federal sources. Alberta, with its large resource revenues, was least dependent on federal sources.

The pattern, then, is one of extensive interdependence between the federal and provincial fiscal systems, marked by a relatively high degree of decentralization combined with an impressive degree of co-ordination. Why has it developed in this way?

At first glance, a tax system in which each level of government is fully responsible for raising and spending its own funds seems attractive. It is the arrangement most compatible with the tenets of classical federalism: in its designated sphere, each order of government is free to exercise its policy discretion. It is only logical that all levels be given the financial means to carry out their assigned responsibilities as they see fit.

Such a system encourages fiscal responsibility and thus accountability. Like individuals, governments are more careful about their actions if they

Figures for 1984 –85 are based on data from Karin F. Treff, "Provincial Estimates fro 1984 –85", *Canadian Tax Journal* 32 (September-October 1984): 1003–12.

a. Includes the Territories.

know that they will be held directly responsible for them. This truism implies that the governments that do the spending should raise the taxes. It is too easy for governments to cater to narrow special-interest groups when they do not need to tax their constituents to finance the implementation of their promises.

Why, then, would a federation opt for any other system? There are a number of reasons. First, the provinces have an uneven fiscal capacity. For a given "tax effort", governments in poorer regions will raise less revenue than those in wealthier regions and, hence, will provide inferior services. Alternatively, they will have to tax at a higher rate to provide a comparable level of public sector goods and services. This poses problems of both equity and efficiency, and it is the primary justification for equalization.

A second problem is that separate income-tax systems are more costly to operate and are inconvenient for taxpayers. Two or more of the 11 different tax-collecting bureaucracies that such an arrangement would require, might stipulate that companies and individuals fill out each year potentially quite different tax-return forms. At a minimum, Canadians would want tax-collection efforts to be co-ordinated and governments to collaborate in the enterprise.

A third problem is that of matching revenues to expenditure responsibilities. Left to themselves, some levels of government would be unable to raise sufficient revenue to carry out their constitutionally assigned expenditure responsibilities, while others would have more than adequate access to funds. The case has traditionally been made that the federal government has taxation capacity beyond its spending responsibilities, while the provinces, and especially the municipalities, are in the opposite situation. This circumstance is a result of the rapidly increasing demands on regional and local governments, coupled with inelastic tax sources. Recently the reverse has been considered more accurate; the federal government now faces the structural deficit problem, while the provinces – at least the resource-rich ones – have the capacity to run persistent surpluses. Whichever way the imbalance may run at any particular time, the implication of this position is that intergovernmental transfers are a necessary part of our fiscal arrangements.

An imbalance between revenue capabilities and expenditure responsibilities might arise because one order of government is excluded constitutionally from one or more of the important taxation sources. Another factor might be that while formal access exists, economic and political circumstances prevent authorities from making full use of some tax sources. Competition among the provinces or municipalities for investment or for skilled labour might lead those authorities to bidding down income and business taxes to, or even below, the costs of services provided. The central government faces less constraint in this respect. Thus it may be more efficient for the central government to levy the "correct" taxes on all income and redistribute the proceeds.

In the fourth place, regional governments operating in a completely decentralized tax and expenditure system might vary their tax and expenditure practices according to any local needs and aspirations they perceived. Such action is perfectly consistent with federalist principles, but it can pose problems for the nation more generally in the form of "spill-overs" and lack of tax harmonization. Both problems stem from the fact that individual jurisdictions tend to ignore the effects of their actions on residents of other regions.

It is inevitable in an economy where products and factors of production are traded between regions that taxation and expenditure decisions in one region will affect output, investment and migration decisions in another. Local authorities will have no reason to worry about these spill-overs, since they are not responsible for them; on the other hand they are not in a position to appropriate any of the political benefit from those spill-overs which are beneficial. Thus some governments may undersupply some services, such as higher education, the benefits of which they cannot fully capture because graduates may migrate to another jurisdiction. Under these circumstances, some citizens will be directly affected by the taxation decisions of a government over which they have no political control, and which they can neither reward nor punish; others, inside or outside local boundaries, will suffer from the undersupply of some forms of public services. One solution is to shift the taxation function and some aspects of expenditure to a more broadly based political authority, one that is responsible to all citizens affected by the policy it exercises.

Another problem stemming from spill-overs is that individual decision makers will not always make the correct decisions if they are not formally responsible for the outcomes. For example, jurisdictions that are able to "export" their tax burden – that is, shift it onto others – will tend to use this revenue source excessively. If citizens of other jurisdictions bear part of the cost, governments will tend to supply more services than residents might otherwise rationally choose. Tax exporting can therefore lead to government that is "too big". Similarly, if a jurisdiction cannot shift its tax burden outside its borders but fears the "leakage" of some of the benefits it provides, it might supply fewer government services than residents might rationally choose, thus producing a government that is "too small". Since a central government is by definition responsible to a more broadly based set of individuals, the spill-over effects of its taxing efforts are less serious, and it may, through shared-cost programs, be able to instigate more appropriate levels of expenditure on service programs under provincial jurisdiction.

A fifth problem is that Canada could eventually find itself with a completely disharmonized tax system in which taxation rates and even definitions of taxable income vary greatly across provinces. This state is the "tax jungle" which so concerned Canadians in the 1930s. Similarly, the nation could produce a completely disharmonized service-delivery system which lacked any portability of benefits and which made widely different services available from one jurisdiction to the next. In either situation, the principle of horizontal equity as applied to federalism would be eroded: that is, individual Canadians who are identical in every respect except in their province of residence and who should be treated equally by the government sector, would, in fact, be treated quite differently.

The obvious rejoinder to this concern is that the desire to implement different social and redistributive policies was the reason for establishing a federation in the first place. One can ask the central government to treat similarly situated Canadians in the same way, wherever they live, but the horizontal equity principle stops there: one cannot always expect provinces to do the same.

Another concern about the potential lack of tax harmony or national standards in service-delivery programs relates to economic efficiency. If labour or capital is treated differently enough by the various provincial tax-expenditure systems, location decisions can be affected; for example, when deciding upon whether and where to migrate, workers will take into account both their expected earnings and the package of government services they receive for taxes they pay. If this – rather than economic productivity – is what shapes decisions to move or to stay, then overall efficiency is sacrificed. However, if taxation can be arranged to remove all fiscal influences from the location decisions of capital and labour, and if governments can provide uniform services across Canada, economic output will again be at a maximum. How better is this uniformity to be achieved than by turning responsibility over to a central government and having it return part of the revenue to the provinces according to a pre-arranged formula?

Provinces can compete only for labour and capital, which are relatively mobile factors of production; but their treatment of less mobile factors, such as land or equipment which is already in place, can vary. This situation may lead provincial governments to turn increasingly to just such sources to finance general expenditures. They bid down, perhaps to zero, some taxes, such as inheritance or succession duties, while they expect others, such as those on property, to bear a greater share of the burden.

In addition, if the processes of federalism engender harmony among provinces, their competition in the matter of tax and expenditure decisions may frustrate the achievement of provincial redistributive or economic-development goals. Generous redistributive schemes may drive out wealthy taxpayers and attract poor ones from neighbouring jurisdictions, undercutting the effectiveness of the scheme. Other provinces will quickly copy tax inducements to investment and in the end will achieve nothing. It may be that only a national government, which is able to exploit some monopoly taxing advantage, can implement a truly redistributive scheme or an effective development program. Distinct regional ventures in these areas, however attractive they may be in principle, may simply be infeasible.

A sixth problem with a decentralized tax and expenditure system is that it may impair the country's capacity to carry out meaningful counter-cyclical fiscal policy. Stabilization policy is traditionally held to be a logical function for the central government. Small regional governments will see most of their efforts dissipated because of the very open nature of their economies. Tax breaks will encourage spending on another province's output as often as they will promote expenditure on local production. Stabilization policy will therefore be less effective. Since the national economy is larger and more self-contained than any provincial economy, this problem is less severe for the federal government. For the Government of Canada to be able to carry out this role effectively, however, it must control a significant part of the total tax and expenditure base. Otherwise, provinces and municipalities might simply offset any federal measures by altering their own taxing and spending decisions in such ways as to reinforce, rather than counteract, the business cycle.

There are three common counter-arguments to this position. First, some economists now deny that any government, federal or other, can actually implement effective counter-cyclical stabilization policies. Secondly, even assuming that there can be a role for the federal government, it is not clear how large a share of total tax sources that government needs to carry it out. The share certainly does not amount to 100 per cent, as is sometimes implied, but it is difficult to know what would be a critical minimum. Finally, it is not necessarily true that provincial governments will act inappropriately.

As Commissioners noted in Part III of this Report, we do not agree that effective stabilization policies are impossible to implement, although we do suggest that several caveats should be observed in applying them. We also believe that the tax and expenditure base for the federal government is sufficient to allow it to conduct effective stabilization policies. We are further convinced that the harmonization of tax systems and the achievement of some national standards of service-program delivery are an important part of our Canadian nationhood; and we have noted instances, such as that relating to post-secondary education, where the absence of conditions attached to federal funding arrangements may have resulted in a serious undersupply of services.

For these reasons we are convinced that the current interlinking of federal and provincial tax and expenditure arrangements is generally appropriate. This arrangement forms a solid basis for development and for program and institutional reforms.

Commissioners next address the mechanisms through which tax and program harmonization occurs. In what follows, we have not attempted to recommend specific proportions of overall revenues and expenditures appropriate for each level of government. In any event, these decisions might vary slightly from year to year, but more important, they can only be made pursuant to broader considerations of tax reform: before we can divide the pie, we must know its size, shape and flavour. That seems to us to require another investigation with a narrower mandate focused on the types of tax-reform issues raised earlier and the division of the resulting revenues.

Tax-Collection Agreements

The federal government presently administers and collects personal income taxes for all the provinces except Quebec. It defines what constitutes income, and what deductions are allowed the taxpayer, and it determines the amount of taxable income against which the provincial tax rate is levied. The provinces then apply a single percentage to the resulting "Basic Federal Tax", to calculate provincial tax payable before credits. At this point provinces are entitled to specify any tax credits of their own, such as those for property-tax allowances or political contributions. The federal government will administer these individual programs for a sliding-scale fee, provided that they meet certain criteria of simplicity and are not construed as altering the essential harmony of the overall tax system. This system is commonly referred to as "tax on tax". A taxpayer is taxed by the particular province in which he is resident on the last day of the calendar year.

The corporate income-tax arrangements are quite similar. The federal government defines the structure of the tax, and the participating provinces (all but Ontario, Quebec and Alberta) set their own rates against it. The provinces levy their rates, however, against corporate taxable income as defined for federal purposes, and not against federal tax payable. This means that the provinces are free to establish their own rate of tax or to vary rates, according to size of enterprise, for example. All provinces, even non-signatories, abide by a common formula for allocating the taxable income of corporations or businesses operating in more than one jurisdiction across provinces, a matter of great dispute in some other federal countries.

These principles suggest two questions concerning the current Tax Collection Agreements. First, do they provide an economical and convenient way of collecting tax revenues? That is to ask, do they minimize cost of administration and of taxpayer compliance? Secondly, do they provide the best possible trade-off between the wish to accommodate governmental autonomy and the need for fiscal harmonization?

There is little evidence to indicate how efficient the current Canadian arrangements are compared with those of a less centralized system. The Ontario Economic Council, however, attempted to estimate the costs to that province of establishing a separate personal income tax. It concluded that they would be "sizeable".[6] This suggests that co-ordinated administration and collection are valuable, and that a loss generated by the establishment of nine more agencies would be unfortunate.

The desirability of harmonization is a more powerful motive for tax collection agreements. The ideal federal tax system has been described as one in which:

> *One obtains the benefits of centralization in the form of tax harmonization and low collection costs while at the same time accommodating the desires of the provinces to pursue their own tax policies and structures in accordance with the desires of their limited constituencies in a manner which does not unduly fragment the economic union.*[7]

How well do the Tax Collection Agreements fare by this criterion?

The arrangements have served us well up to now. Canada has one of the most harmonized tax systems of any federation, notwithstanding its apparently decentralized features. Even non-signatories, for example, abide by the allocation formula for corporate tax. Yet the system still allows considerable regional diversity and offers much flexibility for provinces to decide how to raise their revenues.

The problem, however, is that this high degree of harmony and co-ordination shows signs of breaking down. Alberta has recently withdrawn from the corporate income tax agreements and established its own system. British Columbia has threatened to follow suit. Two provinces, Ontario and Alberta, have recently considered publicly withdrawing from the personal income-tax arrangements unless certain changes are introduced. In 1979, Quebec initiated a Stock Savings Plan which allowed a resident of that province to deduct up to $15 000 from provincial taxable income corresponding to purchases of new shares of Quebec companies. British Columbia recently introduced a Housing and Employment Bond Tax Credit which Ottawa has agreed to administer, and which will "erect barriers to interprovincial flows of enterprises and capital".[8]

A process which once was flexible enough to balance the need to accommodate regional diversity with the economic benefits of a nationally consistent tax environment has recently fallen somewhat short of meeting the challenge. In part, this is because the demands on it have increased significantly. Provinces now pursue a broader range of objectives in their economic and social policies, and are therefore much more insistent on indicating what tax policies they need.

When provincial and federal income-tax systems interlock, to change the federal revenue system can raise serious problems, for changes which increase or decrease taxable income necessarily affect the level of provincial revenues. For this reason, provinces have called for full consultation before such changes are made and have frequently criticized perceived federal failures to act on their request. Well-known examples of unilateral federal moves are the introduction of indexing of personal income tax in 1974 and the significant structural changes of the federal budget of November 1981. (It was the latter move which prompted Ontario to consider the feasibility of withdrawing from the Tax Collection Agreements.) The tradition and practice of budget secrecy exacerbates the difficulty, since it effectively precludes advance consultations with, or advice to, provincial governments. The same is true with respect to federal understanding of proposed provincial budget initiatives.

There are two views about what should be done in the matter of the Tax Collection Agreements. One view holds that these arrangements should not be changed. Provinces have remained party to the Agreements to this point because they derive considerable benefit from them; a mass defection would be highly unlikely. Even if the process of fragmentation were to continue, however, it might not pose a serious problem. Canada's tax system is highly co-ordinated now, not because of the good will of politicians and public servants, but because the provinces, as small open economies, have little freedom to deviate from the practices of others without suffering economically. As locally sovereign jurisdictions, they are entitled to choose to do so anyway: poor decisions will be reflected in the results of the next election; good ones will be picked up and implemented by other provinces and eventually accepted by the federal government.

The alternative view does not deny the rationality of economic and political actors, but recognizes that some situations can lead them to behave in mutually destructive ways. Indeed, chains of action and reaction can leave everyone worse off than before. Rules which are commonly agreed to and clearly stated at the outset can do much, however, to prevent this type of mutually destructive behaviour.

Commissioners base a number of conclusions and recommendations on this analysis. The Tax Collection Agreements have served Canada well. They provide a considerable convenience to both citizens and governments. As a powerful inducement to maintain tax harmonization, they also strengthen the economic union. Therefore, they should be retained.

Nevertheless, the agreements are presently under considerable strain. The prominent role of provincial taxes in Canada's public finances, the often acrimonious nature of federal-provincial fiscal negotiations, and the tendency of provincial tax structures to diverge are all points that raise important issues. Canadians wish to maintain the agreements, but without diminishing either the accountability of legislatures or the flexibility of the system.

Provinces have two important concerns with the existing arrangements. First, the federal government is not required to notify provinces in advance of federal changes in the tax base or rate structure, although such changes will inevitably affect provincial revenues. However, the agreements provide a one-year revenue guarantee: where a federal change reduces provincial receipts by more than 1 per cent, provinces are compensated for the loss for one tax year, to give them time to adjust their rates in light of the change.

Unilateral federal changes are a greater problem for the personal income tax than for the corporate income tax, because of differences in the way the agreements are implemented. In the corporate case, provincial tax rates are applied to the federal tax base; this means that federal rate changes do not affect provincial revenues; only changes in the base do so. In the matter of the personal income tax, provincial rates are applied after the federal rate has been set. This Commission recommends that the agreements be amended to place the personal income tax on the same footing as the corporate tax: that is, to apply the provincial rates to the common, federally-determined base. This measure would both reduce provincial vulnerability to federal tax changes and increase provincial autonomy, since provinces would be freer to make their own decisions about how progressive their tax structures should be. Earlier tax-collection agreements ensured uniformly progressive tax structures across the country; however, the permission given to provinces to include various tax-credit and -exemption programs in their tax administration has already modified this uniformity.

A second potential irritant is that while provinces and the federal government share the revenue base and have equal constitutional authority for taxation, it is the federal government which determines the tax base for provinces within the agreements. Some analysts argue that the tax bases should be determined jointly through negotiations among the participating governments and altered only by common consent.

This Commission does not recommend such a course. To require intergovernmental agreement on all changes to the tax base would unduly hamper flexibility and would reduce the federal government's accountability to Parliament for its financial activities. Under the present system, a province can opt out of the Tax Collection Agreements if it finds federal actions intolerable; the threat that it might do so is a reasonable guarantee of federal sensitivity to provincial interests. Moreover, under the agreements, provinces are permitted to request a variety of tax credits and exemptions which allow them considerable flexibility. The federal government will agree to administer such provincial programs if they meet three conditions: they must be administratively feasible; they must apply to income actually earned in the province involved; and they must not interfere, or have the potential to interfere, with the economic union. The great majority of provincial requests have been accepted, though some, such as British Columbia's proposals for a dividend tax credit for firms in the province, have been refused. Again, the incentives seem roughly right in this case: a province committed to a program can opt out of the agreements to implement it; the federal desire to avoid that occurrence should make it sympathetic to provincial proposals.

Although there is no need for fundamental change, two additional proposals would help to improve co-ordination of tax systems. First, as part of our larger concern to reduce the comprehensive budget secrecy Canadians have experienced and to ensure wide discussion of budget proposals in Parliament and provincial legislatures, Commissioners recommend that in developing any tax change which would significantly affect the federal-provincial relationship, the federal government consult with provinces in advance. Secondly, while we endorse the quinquennial review of federal-provincial fiscal arrangements, we suggest that the Council of Ministers of Finance should extend this consultation process to include a regular and broad review of current practices. To assist the Council, we recommend that a federal-provincial Tax Structure Committee of officials be formed to assess definitions of taxable income, basic exemptions, marginal tax rates and related issues, and to monitor the division of tax room between the two orders of government in light of anticipated revenue and expenditure needs.

Commissioners emphasize that these proposals are meant to "fine-tune" a process which already works reasonably well. Co-ordination of fiscal arrangements and harmonization of the tax-collection system represent two of the achievements of our federal system.

Intergovernmental Transfers

As governments have extended their activities in the post-Second World War period, all federal systems have made increasing use of intergovernmental transfer arrangements. These arrangements permit one order of government to share in the funding of programs of another order by transferring funds or tax-collection authority. In Canada, the federal government transfers money and tax "room" to the provinces, and provincial governments transfer cash to municipal authorities and hospital boards.

In Canada, these transfers are massive. In 1983–84, the federal government transferred a total of $17.6 billion in cash payments to the provinces. Of this amount, about $5.5 billion took the form of "general purpose" or "unconditional" grants, mainly equalization payments. The remainder took the form of payments linked to specific programs. A total of $7.6 billion formed the cash portion of transfers under the Established Programs Financing arrangements, covering federal aid to health care and post-secondary education. Another $4.6 billion related to other shared programs. By far the most important of these is the Canada Assistance Plan, which received $3.1 billion. In addition, the Established Programs Financing arrangement, originally enacted in 1977, has divided the federal contribution to these programs into a cash portion and a transfer of equalized tax points. In 1983–84, the latter had the value of another $6.6 billion. The dollar value of all these transfers tripled between 1974 and 1984.[9]

The size of these figures suggests that management of intergovernmental transfers is a major issue for the federal system. Two sets of questions have loomed large in recent years and promise to pose difficulties for the future. The first set relates to whether there should be limits on the power of the federal government to spend funds in areas under provincial jurisdiction: To what extent should the federal government be able to use its spending power to project the national interest into areas not under direct federal authority?

The second set of questions arises from the serious strains created as governments struggle to restrain expenditure growth in order to reduce the size of public sector deficits: How will efforts to restrain spending at one level spill over to affect the programs of the other? Will cut-backs effected by one order of government increase the demand for services at the other? Alternatively, will they reduce the financial capacity of the other to pay for them? More specifically, should federal transfers to the provinces be protected or privileged in any way, given the high degree of provincial dependence on them?

While such concerns are never far from the surface in any federal country, both became particularly prominent in Canada after 1980. They were reflected, first, in the debates on federal-provincial fiscal arrangements and Established Programs Financing in 1982–83; later, they surfaced in the debate about health-care policy surrounding passage of the Canada Health Act in 1983.

Background

Intergovernmental transfers have been a key instrument in allowing the Canadian federal system to adapt to the new roles of government. While many of the new responsibilities of government clearly lay within areas of provincial jurisdiction, they were often beyond the financial means of provincial governments. Publicly financed health-insurance or greatly expanded post-secondary education systems, for example, were simply too costly for most provincial governments to support on their own. Moreover, in post-secondary education, where the mobility of graduates meant that spending by one province would spill over to benefit others, individual provincial governments, acting quite properly in their own interests, would provide a less extensive service than would be desirable from a national perspective. Federal assistance was required, therefore, to meet total national needs. Given the obstacles and objections to the constitutional transfer of all these responsibilities to the federal government and the broader desire to retain the advantages of federalism, a solution was found in the shared-cost program under which that government would pay part of the costs of meeting new needs. This program became the hallmark of post-war co-operative federalism, not only in social policy, but also in a wide range of economic development programs, such as construction of the Trans-Canada Highway. Today there are shared cost agreements, large and small, bilateral and multilateral, in almost every program category, and in virtually all government departments.

A wide variety of particular arrangements is possible under the shared-cost program. In general, these may be divided into two broad types: cost-matching arrangements and block-funding arrangements. In cost-matching arrangements, the federal government agrees to reimburse provincial treasuries for some fixed proportion (usually one-half) of provincial expenditures on programs covered by the agreements. The clearest current example is the Canada Assistance Plan, through which the federal government reimburses provincial governments 50 per cent of the costs of social assistance and social service programs, provided that the support goes to people "in need or likely to become in need". The post-secondary-education/financing arrangements in force from 1967 to 1977 comprised a slight variant under which the federal government transferred 50 per cent of institutional operating costs.

In block-funding arrangements, the federal transfer is less directly related to specific program costs and, instead, takes the form of an equal dollar-per capita transfer multiplied by the provincial population. The pre-1977

Medicare grant, for example, was based on the national average per capita costs of medical insurance programs in each year.

The major current block-funding arrangement is Established Programs Financing (EPF). Under that arrangement, transfers from the federal government to provinces are calculated in the following way. First, the per capita operating costs of health insurance and post-secondary education are established for 1975–76, the base year. Then one-half of this amount is compounded each year by an amount equal to the three-year moving average of nominal gross national product (GNP) increases. Finally, the result of these calculations is multiplied by the provincial population in the year for which payment is to be made. The subsequent transfer is made in the forms of cash and tax room. It is apparent, then, that block-funding transfers are not totally unrelated to program expenditures. EPF funding is related to 1975–76 program costs. However, the relationship deteriorates over time. There are also mixed transfer mechanisms: for example, the Hospital Insurance and Diagnostic Services transfers of 1957 to 1977 were based on 25 per cent of actual provincial expenditures and 25 per cent of national average per capita costs.

Cost-sharing arrangements may be more or less strongly conditional. In highly conditional programs, the federal government defines quite specifically the terms and conditions which provincial governments must meet in delivering programs if they are to qualify for the federal grant. Under less conditional arrangements, the provincial government receives funds almost regardless of the nature of its programs. The current funding arrangements for post-secondary education are highly unconditional: provinces receive transfers regardless of the support which they, in turn, provide for post-secondary education. By contrast, the current funding arrangements for health insurance under EPF and the Canada Health Act are highly conditional: provinces must deliver health-insurance programs which meet clearly defined criteria, and they are subject to clearly identified financial sanctions if they fail to do so.

Finally, as we have already mentioned, transfer arrangements may provide for the transfer to be in the form of either cash or tax-collection "room" which the federal government vacates in favour of provincial treasuries. The EPF arrangement, for example, provided for the federal government to withdraw from 13.5 percentage points of personal income tax and from 1.0 percentage point of corporate income tax, and allowed provinces to "occupy" that tax room and collect the revenues; this vacated tax room was intended to make up one-half of the total federal EPF transfer. Where funding is provided through tax transfers, federal control of provincial programs declines: tax points, unlike cash, cannot be cut or withdrawn; and provinces see tax points not as labelled for, or targeted to, specific programs, but rather as part of their general revenues. Responding to federal concerns that cash and tax transfers for post-secondary education were being diverted to other uses, provincial treasurers tended to reply that under EPF, there was no longer a direct link between the transfer and specific purposes; in their view, the transfer could be spent for any provincial purpose. While the federal government considered the transfers to be "incentive grants", designed to influence provincial priorities, provinces tended to treat them as unconditional.

Taken together, all these elements of intergovernmental transfer arrangements make for a bewildering picture. However, the complexity provides at least one great service to Canadian governments: it makes the arrangements potentially very flexible. For example, if we Canadians wish to decentralize our fiscal system further and to provide more power and authority to provinces, we shall tend to choose arrangements which are block-funded, and which have few conditions and a significant tax-point transfer. On the other hand, clearly defined conditions can be imposed, among other purposes, to create a somewhat higher degree of centralization and national standards.

The federal and provincial governments have debated the character of transfer arrangements with the introduction of each major shared-cost program. In the 1950s and early 1960s, with the important exception of Quebec, there seemed to be broad consensus that these programs were an appropriate means to achieve desirable national standards, and to ensure that the full range of modern government services was available to all Canadians. Provinces themselves often called for greater federal financial involvement in the rapidly growing areas which were under provincial jurisdiction.

By the 1960s, consensus began to erode. Quebec governments had rejected shared programs even before the 1960s, on the grounds that they represented an unconstitutional use of federal spending power to invade provincial jurisdiction and to impose "national" values on a distinct Quebec society. This essentially negative reaction to federal programs was reinforced after 1960 as successive Quebec governments embraced the Quebec state and sought to use it to expand their own programs and to develop that province's society. The call, therefore, was not simply for federal restraint, but for increased provincial fiscal ability to pursue provincial priorities. One result was the Established Programs (Interim Arrangements) Act of 1964, which allowed any province to "opt out" of a large number of shared programs and to receive, through a combination of tax points and "topping-up" payments, funds equivalent to the funds that the federal government would have spent on the program if the province had chosen to participate.

Only Quebec took advantage of the arrangements to opt out, but as the welfare state matured, other provinces, growing more confident in their ability to manage their own affairs, increasingly resisted new federal initiatives. They also became more critical of federal "intrusions", arguing that they skewed provincial priorities, subjected provincial fiscal planning to the vagaries of federal decisions, and reduced provincial government flexibility, leading their legislatures to favour program areas where federal funding existed and to neglect those areas where it did not.

Further strains had developed by the 1970s. First, the federal government was concerned that Quebec's opting out and acceptance of tax points conferred a *de facto* special status; it therefore sought ways to restore the balance among provinces. Secondly, the federal government became more concerned about its ability to control its own expenditures; federal commitment to supporting 50 per cent of program costs implied that the provinces' decisions determined a large part of federal spending. Moreover, the federal government worried that shared-cost programs generated few incentives to restrain spending: the arrangements implied that provinces could count on "fifty-cent dollars" for new expenditures; by the same token, if they did restrain spending, provincial treasuries retained only half of any savings.

All these forces pushed the federal government towards less centralized fiscal arrangements and underlay passage of the Established Programs Financing Act in 1977. The details of the arrangements were complex, but the principles were reasonably clear. Decentralization would be achieved by block-funding, by tax-point transfers and, for post-secondary education, by elimination of any direct link between either program expenditures or the terms and conditions under which programs were delivered. Overall costs would also be reduced by severing the links between payments and actual program costs; henceforth payments would be tied to increases in GNP, which, at the time, was rising more slowly than program expenditures. Federal contributions would be controlled and provincial incentives to restrain expenditure growth increased. Moreover, since the payments would be recast into a combination of cash and a transfer of tax points, all provinces would be brought more closely into line with Quebec.

The arrangements represented a major step towards greater provincial autonomy, towards "disentanglement" of federal and provincial responsibilities, and towards restraint. Once again, the flexibility of intergovernmental transfer arrangements had been demonstrated. However, the arrangements did not go the whole way to decentralization: the conditions attached to hospital insurance and Medicare remained unchanged; and provinces agreed to consult the federal government with respect to spending on post-secondary education.

By 1982, the situation had changed. First, rapid inflation in nominal GNP caused federal transfers to increase even faster than they would have done if they had remained tied to actual spending. Then, because of a guarantee built into the EPF formula (that the value of the tax points transferred to the provinces would always at least equal the value of the cash portion of the grant), as the recession hit, and as the yield of the transferred tax points declined, the proportion of federal transfers in the form of cash payments increased. Moreover, since transfers were no longer tied to program spending, the federal government believed that it had lost what little control it had once exercised over program content and standards. In a sense, the provinces had done with a vengeance just what EPF had invited them to do: they had restrained their expenditures in both health care and post-secondary education. In the health field, many provinces were experimenting with "user fees" and "extra billing" to limit the costs of health programs to provincial treasuries and thus reduce provincial, but not federal, spending. This led to federal concern that provinces were diverting funds to other purposes, with the result that, in post-secondary education especially, the federal share of total costs was rapidly increasing. Moreover, public opposition to perceived cut-backs and, particularly, to extra billing and user fees in health services translated into calls for federal action. Finally, in the wake of the Quebec referendum and the constitutional debate, the federal government had become increasingly concerned about fiscal decentralization and the erosion of federal power. It believed that it had made too many concessions to the provinces, reducing its ability to affect vitally important programs, to account to Parliament for its expenditures, and to maintain direct links with citizens.

The federal government considered that the time had come to redress the balance; in 1982, it sought to regain some control over total expenditures and to restore a degree of influence for its programs. It capped, or established an upper limit on, transfers for post-secondary education and announced its intention to seek negotiations aimed at developing national standards and a defined federal role in that field. It also proceeded to develop the Canada Health Act. Its aim was to define clearly the original program conditions: universality, portability, accessibility, comprehensive coverage and public administration. In addition, it undertook to eliminate extra billing and user fees by applying dollar-for-dollar reductions in the federal transfers to provinces which used these devices. No federal-provincial agreement was reached on any of these issues, but since these were federal spending programs, the federal government was able to proceed on its own.

The intergovernmental debate focused on the complicated details of alternative formulae for transfer arrangements. The debate raised a larger question, however, about which alternative, in 1982, Canada should pursue. On the one hand, we could move farther along the path indicated by the EPF in 1977, and continue to decentralize transfer arrangements by making the transfers totally in terms of equalized tax points, by extending them to the Canada Assistance Plan, and by eliminating the conditions in the original Medicare and hospital-insurance programs. On the other hand, we could move back from the 1977 arrangements and return to more conditional funding arrangements by requiring provinces to be more accountable to the federal government for their use of federal transfers, and by developing a more direct policy-design role for the federal government. EPF might well have responded to the political requirements of the time, but it falls squarely between these two alternatives. And this, argues one observer, accounts for the instability of the arrangements. His conclusion with respect to post-secondary education applies to other areas as well:

> *The Government of Canada must decide whether it means the PSE [post-secondary education] fiscal transfers to be program-related or not. If it believes they* should *be, then the scale, and/or the rate of growth, of the federal payments (transfers) must be related to some measure of the scale, or [to] the rate of growth, of expenditures in the provinces on or for PSE . . . If, on the other hand, the Government of Canada means simply to make an unconditional per capita grant to the provinces . . . then all reference to post-secondary education should be removed from the Act. It is as simple as that.*[10]

The issues raised by EPF and by the Canada Health Act extend to larger questions about the federal spending power and its place in Canadian public policy.

The Federal Spending Power

Most shared-cost programs, as well as many programs (such as family allowances) which make payments to individuals, represent exercise of the federal spending power. The spending power is usually regarded as one of a number of general discretionary federal powers. Unlike the declaratory and disallowance powers, however, the federal spending power is nowhere explicitly defined. Rather, it is held to derive from more general principles. In part, it derives from the power of Crown prerogative, for all public revenues belong to the Crown, which is "a person capable of making gifts or contracts like any other person, to anyone it chooses to benefit." The Constitution requires that the Crown have the approval of Parliament or legislature; when this approval is obtained, the government may distribute revenues as it sees fit. This view implies that the donor of public revenues has the power to attach conditions to the grant, and the recipient has the power to refuse it.

The spending power has also been justified in the Constitution Act, 1867, under section 91(1A), "The Public Debt and Property", and under section 102, which authorizes a Consolidated Revenue Fund. Together these sections are said to confer on the federal government the right to spend for any purpose "provided the legislation does not amount to a regulatory scheme falling within provincial powers."[11]

Remarkably little constitutional assessment of the spending power has been attempted in the courts. Federal-provincial/shared-cost agreements have not been the subject of extensive legal challenges, and it does not appear that there are constitutional restrictions on the federal power to offer conditional grants to the provinces. The provinces are ultimately protected by their power to refuse to participate in these agreements; in political terms, however, this power may be more theoretical than real. The remaining constitutional uncertainty lies in grants awarded by the federal government to individuals and institutions, especially when such grants might be interpreted to constitute regulation within an area of provincial jurisdiction. Again, in this instance, the limited jurisprudence provides little guidance.

The question of limiting the federal spending power lies primarily in the political realm. This Commission believes there are a number of considerations which must be brought to bear. First, the federal government, in the name of national citizenship and the national political community, has the right and responsibility to respond to emergent needs and to changing conceptions of the national interest. The record of the past emphasizes the fact that the national interest is not static: rather it changes in response to changing international circumstances, changing issues, changing conceptions of citizenship, and changing aspirations. Matters once considered of purely local interest can, and do, become defined as national questions which demand national responses. There will often be emerging issues where provincial activity, even within provincial jurisdictions, is not a matter of indifference to the federal government. Where the federal government does not possess the constitutional authority, and where provinces are unable or unwilling to respond effectively to new needs, there is in the future, as there was in the past, a case to be made for wide federal freedom to put forward proposals for shared-cost programs.

Such proposals provide a strong guarantee of the federal principle: they provide a very strong incentive for the federal government to look first to its own jurisdiction and to consult before proceeding, in order to maximize its chances of winning the requisite provincial support. They also ensure the fullest possible debate: the federal government would be required to mobilize public support for its proposals, and provinces would have to justify any opposition before their own legislatures and electorates. It is probable that most of the major programs now in existence would still have been developed under such a scheme; the greater bargaining power this method gives to provinces, however, suggests that their legislatures might have been able to use the need for consent to win more favourable terms from the federal government or to gain leverage in other policy domains. Commissioners are not inclined to favour consent mechanisms which are too rigid, or which unduly hinder the Parliament of Canada from exercising its legitimate rights and performing its responsibilities.

A third option is provincial opting-out, an approach with which we have had considerable experience in the past. The concept is incorporated in the new constitutional amending process. In a sense, the right to opt out of a shared-cost program has always existed; no province is constitutionally obliged to participate. Most opting-out proposals, moreover, significantly reduce the provincial costs entailed by including compensation, or "fiscal equivalence" payments, to the non-participating provinces. Thus, the Canadian Bar Association recommended that any province should be able to opt out of a program and receive compensation equivalent to the amount of money it would have received from the federal government, provided that the province agreed to provisions respecting interprovincial portability. The 1969 federal proposal also included fiscal compensation, but in the form of grants to citizens, rather than to provincial governments.

Serious objections have been raised against opting-out. There is the fear of a chequer-board Canada, for of what validity are "national standards" if they exist in some provinces but not in others? Would federal MPs be permitted to vote on programs which do not operate in their home provinces? Why should federal revenues be turned over to provincial governments that are unwilling to participate in national programs which have broad public support and are constitutional? In spite of all these contrary arguments, however, opting-out has been defended on the grounds that it introduces a high degree of flexibility into the federal system. In particular, it allows a response to the distinctiveness of Quebec, while avoiding a situation in which Quebec might be able to block a program which is considered highly desirable in other parts of the country.

The spending power has been a vital instrument of flexibility and of response to changing definitions of the national interest. Commissioners believe it should be retained, subject to a number of guidelines. First, while we believe that this power is and should be a broad one, we are also convinced that it is not unlimited. We consider the judicial distinction between the federal legislation which makes grants or gifts and that which involves direct regulation in the fields of provincial jurisdiction, though it is not fully developed, to be the appropriate one. We believe, for example, that federal loans, tax credits or grants to post-secondary students would be constitutionally justified, but that if they were to be used to require universities to establish entrance conditions, they could be challenged as an invasion of provincial jurisdiction. We hold the opinion that it is appropriate for the Supreme Court to spell out the constitutional limits more fully as it considers future cases.

Secondly, following the Rowell-Sirois Report, we believe that in principle, the federal government should look to a shared-cost program as a last resort, rather than as a first resort. Indeed, in many cases, it will be desirable to seek to mesh federal and provincial activities under a shared-cost program. In general, however, the democratic objectives of accountability and clarity of roles are more effectively secured if a government pursues programs under its own jurisdiction.

Thirdly, use of the spending power in an area of provincial jurisdiction requires broad national consensus. A reformed Senate with stronger regional representation would provide one device to secure this end. However, since such a Senate would represent individuals, and not governments, and since it is governments which are involved in the development and administration of shared-cost programs, even a reformed Senate would not provide a sufficient solution. Provincial governments must be directly and fully consulted.

Federal-Provincial Ministerial Councils should provide an effective vehicle for consultation. Commissioners would go beyond this proposal, however, and require the Prime Minister to make every effort to obtain broad consensus of First Ministers in advance of federal legislative action. Under present arrangements, consultation almost always occurs over new programs, since it is essential to their success that provinces agree to participate. Consultation is even more necessary, however, when the federal government proposes either to alter the terms and conditions of a program or to terminate it; since provinces are already participating, it is difficult for them to respond to such changes by leaving the program. We therefore believe that there should be considerable advance notice and opportunity for debate before conditions are changed or programs are terminated. It could be standard practice, for example, to design shared-cost programs so that they operate for five-year periods, as has been done with fiscal arrangements. At the end of each five-year period, the program would be renegotiated, but neither order of government would be able to alter the conditions unilaterally within the period.

Finally, we believe that flexibility and opportunities to innovate will be enhanced to the extent that the conditions of shared-cost programs are stated in terms of goals or ends, and the federal government does not dictate specific administrative means, but leaves their determination to provincial experience and initiative.

Federalism and Fiscal Restraint

A potential source of significant tension in federal-provincial fiscal relations in the present context concerns the cutting and trimming of programs for financial reasons. Again, the problem flows from interdependence and from the likelihood that in the foreseeable future, all governments will be anxious to restrain expenditure and to manage their finances. The efforts of one order of government to do so will inevitably affect the budgetary situations of the others.

This development can come about in several ways, even when there are no fiscal transfers involved, and when each level of government is operating in its own jurisdiction. For example, a federal tightening of unemployment-insurance provisions might generate increased demand for provincial welfare services. In turn, provinces might try to reduce their welfare burden by instituting short-term/work programs which would last just long enough for the participants to qualify for Unemployment Insurance. More generally, one government's reductions in almost any area would be likely to generate political pressures on another order to step in to fill the gap. Commissioners make no recommendations here; the problem simply calls for sensitivity.

Of more direct interest are intergovernmental transfers. As fiscal conditions have become more volatile in recent years, numerous government actions have been taken which affect the level of transfers: these include a rapid series of changes in equalization as the system tried to respond to escalating oil and gas revenues in the 1970s; the capping of the escalators for post-secondary education and health-insurance transfers in the mid-1970s; or the more recent capping of post-secondary education transfers under the "Six-and-Five" anti-inflation program.

The question which arises is whether such transfers should be in some way insulated or protected from these kinds of budgetary changes. One perspective suggests that indeed they should be. This argument is based on the need for fairness and certainty, as well as on recognition of the high degree of provincial dependence on intergovernmental grants. Provinces, it is claimed, have been induced to participate in these programs on the understanding that the federal government would continue their support. They cannot effectively plan their own budgets if the amount of transfers remains uncertain. A particularly strong argument is sometimes made that equalization payments should be shielded from federal measures to control deficits, especially in light of the constitutional commitment to sharing now found in section 36 of the Constitution Act, 1982.

Those who view the situation from the contrary perspective ask: Why should the programs which happen to be delivered through intergovernmental mechanisms be privileged in any way over other kinds of federal expenditure? True, we justify these programs by reference to national objectives and national standards, but programs fully in federal jurisdiction presumably have similar justifications. True, budgetary uncertainty makes planning difficult, but tax revenues are also inherently uncertain; indeed, coping with uncertainty is part of the problem of governing. While the federal government may have induced provincial governments to enter particular program areas by offering cost-sharing arrangements, provincial governments have often initiated the requests for federal sharing. Moreover, if intergovernmental programs are protected, then any federal restraint measures will have to be concentrated disproportionately on a limited range of unprotected programs. Thus, in 1984, with about one-fifth of federal spending taking the form of intergovernmental transfers and another fifth covering interest on the national debt, federal restraint measures would have to be concentrated on relatively few areas of discretionary spending. If transfers to individuals are also to be considered protected, then almost 70 per cent of federal spending would be locked in, and federal flexibility would be greatly reduced.

An interesting sidelight on these intergovernmental transactions is that it has fallen to the federal government to assume responsibility for most of Canada's public sector deficit. Without the tranfers, the federal deficit would be much smaller and the provincial deficits much larger. Thus, in 1982, the federal deficit, excluding intergovernmental grants, stood at $4.7 billion, but after the grants were included, it rose to $20.5 billion. The same thing happened at the provincial-municipal level. Before transfers were counted, provinces had a surplus of $7.4 billion; after grants to local authorities and hospitals were included, the provinces were in deficit by $1.6 billion. Local governments and hospitals are the massive recipients of transfers: collectively, they were in deficit by $25 billion in 1982, based on their own revenues; after transfers from other governments, they were roughly in balance.

In light of these considerations, how might Canada retain a desirable degree of federal flexibility and accountability to Parliament, while assuring provinces of some stability for their planning, and while protecting them against rapid unexpected variations in federal spending? The simplest option would be to require the federal government to give the provinces advance warning of proposals to cut federal transfers. One year's notice before the implementation of cuts, for example, would give provinces some time to adjust their revenues and expenditures to planned changes. This scheme, however, would provide only limited protection for provinces.

A second possibility is to review federal-provincial/transfer arrangements every five years and to limit the changes that the federal government can make, between reviews, without provincial approval. Such an arrangement could, for example, allow the federal government to adjust payments in any given year by up to 5 per cent; any greater changes would require provincial consent. An appropriate formula would have to be worked out. Alternatively, the federal changes in intergovernmental transfer programs could be linked to the average level of reductions in non-transfer programs.

A number of other proposals governing the application of federal restraint have also been made. For example, social programs could be insulated from any reductions. However, since these programs represent well over 80 per cent of all intergovernmental transfers, to exempt them would severely constrain the federal government. Another possibility is to vary the amount of reductions to take account of differences in provincial levels of need; we Commissioners discuss the difficulties of such a procedure in our analysis of equalization. Finally, provinces with higher revenues could bear the brunt of reductions, and poorer provinces could be protected. We believe, however, that the equalization program, and not individual shared-cost programs, is the appropriate mechanism for dealing with revenue disparities.

Again, to achieve balance is fundamental: the federal government must have enough fiscal flexibility to control its own budget, but it should not be able to cut with impunity transfers for shared-cost programs. We believe that to give one year's notice of changes in these programs provides inadequate protection for the provinces. Rather, we consider it best to specify in advance the limits on permissible reductions. Furthermore, apart from conditions spelled out in the enabling legislation, the federal government should leave the provinces full freedom to decide for themselves how best to adjust their own programs and administrative systems to any reductions.

Finally, Commissioners believe that the managing of restraint is likely to cause major strains in the federation in the coming years. The temptation for each order of government to pass off its fiscal problems to the other will be acute, and the political pressure on the federal government to react to provincial measures will grow. To deal with such inevitable tensions will require a high degree of common trust, open exchange of information, and resilient institutions.

Intergovernmental Relations and the Institutions of the Federation

Commissioners have already reviewed the strengths and weaknesses of Canada's national institutions. Here we discuss more comprehensively the institutions of Canadian federalism: the division of powers, the amending formula, and the machinery of intergovernmental relations. Given the difficult policy choices with which we Canadians are confronted, how can we reform these institutions so as to facilitate effective policy making? How can these institutions better reflect the democratic values of openness, accountability and responsiveness that underlie the optimum approach to institutional change? This Commission's terms of reference asked that we respect "the spirit of the Constitution" and "assume a continuing Canadian federal structure not significantly different from its present form." Here we provide some thoughts about that spirit and suggest refinements to that structure, in light of Canada's current needs and values.

One of the most insistent messages which we Commissioners received in our hearings was that relations among federal and provincial governments appeared to be in disarray. There was simply too much conflict, too much bitterness and mistrust. Federal-provincial relations gave the impression of steady confrontations, with reporters and camera crews standing ready to dramatize the conflicts. The capacity of the country to deal with the concrete and pressing issues put forward seemed vitiated in a struggle – of more interest to the governments involved than to the citizens they represented – for position, for status, for "turf". Such conflict troubles Canadians because it diverts attention from the substance of policy and threatens to undermine confidence in our political institutions, perhaps even in the legitimacy of the constitutional order itself.

Canadians were concerned, too, about the actual or potential threats our practice of federalism holds for democratic values. As governments have more and more shared responsibility, it has become harder and harder for Canadians – and indeed for governments themselves – to determine which authorities are responsible for what areas of administration. Intergovernmental relations, a product of shared or overlapping responsibility, disproportionately involved the executive and bureaucratic levels of government. Intergovernmental consultation and agreement have removed important areas of policy from parliamentary control. Preoccupied with the intergovernmental dimension of their responsibilities, policy makers may be less inclined or less able to respond to groups whose concerns are not territorially defined. The intergovernmental process is often secretive, and issues disappear into the intergovernmental maze. As vital issues have been caught up in this process, interest groups have realized that their concerns are at stake. For this reason, they have insisted on broader access to the process, as demonstrated in the constitutional discussions of 1980–82 and in the debates on the Canada Health Act in 1983 and 1984.

The record demands, however, that these criticisms be tempered, for even in the periods of most bitter conflict, effective policy co-ordination was maintained in many areas. Moreover, the personalities of the chief participants and the weaknesses of the institutions are not the sole sources of conflict. Some features of the relationship do spur conflict: the primary cause has been genuine differences in interests, both regional and intergovernmental, differences which are, in effect, a natural outcome of regional diversity in the federation. In the consequent struggles, governments represented not only their own political interests, but also important visions of Canada and the material interests of their residents. It is unrealistic – indeed undesirable – to expect our institutions and intergovernmental arrangements to eliminate conflict. Nevertheless, we must try to ensure that they will not generate and perpetuate unnecessary conflicts based primarily on concerns for status.

Competition among governments, overlapping of functions, and duplication of services are inherent in federalism; indeed, they are one of its chief advantages. Policy is likely to be more responsive when citizens can turn to another level of authority if they find that the first does not listen to their concerns, and when governments compete for voters' allegiance. When issues are debated in intergovernmental forums, as well as in the legislatures, the full range of policy concerns and options is more likely to be canvassed. Thus while we Canadians must seek to establish mechanisms that avoid the intensive conflicts of recent years, we must also recognize that federalism, like other elements of Canada's institutional framework, encourages competition and adversarial relationships which are seen as essential methods for enhancing the well-being of Canadians.

Finally, the very concept of accountability becomes complex in the federal context. The basis of accountability must remain the political responsibility of each government to its own residents, in 11 systems of government, rather than one. For our federal system, however, the Constitution provides an additional standard of accountability. Thus each legislature's majority, however large, will be subject to some restraints. The Canadian Charter of Rights and Freedoms limits the autonomy of governments. To the extent that governments make formal agreements, as in shared-cost programs, for instance, they have commitments to one another on the basis of contractual federalism. We should also realize that the problems that federalism poses for responsible government are only part of the challenge that the growth of the state poses for democracy. Thus we Canadians must seek to establish balance in our federal institutions. We must try to find middle ground between unregulated competition and implausible harmony, and between accountability of governments to citizens and collaboration among governments. These considerations suggest that it is important to define more clearly the "spirit of the Constitution".

Federalism and Constitutionalism

Constitutionalism in our federal system derives from several sources. First, there is constitutional law as interpreted by the Supreme Court of Canada. Secondly, there is convention: long-standing evolving principles, such as that of responsible government, and unwritten practices which, by tradition, by repeated precedents, and by the fundamental commitments of leaders, have become an accepted part of our constitutional order. The remedy for violations of convention lies chiefly in the political process, although the courts may, on occasion, intervene. In the recent Constitutional Reference case, for instance, the Supreme Court of Canada recognized and defined the convention of substantial provincial consent to constitutional amendments as an integral part of our Canadian constitutional order, though not a judicially enforceable requirement. Thirdly, there is the concept of prudence, or self-restraint, on the part of decision makers. This quality is more than the simple desire to avoid antagonizing voters: politicians ought to have in mind – and often do – the effect their actions will have on the wider social fabric; of the extent of conflict these actions are likely to engender; of the consequences for national unity; and of the co-operation required of other jurisdictions. The chief elements of the spirit of our Constitution derive from these varied sources. They help Canadians to reconcile majority rule and minority rights, the interests of Canadian society and of provincial societies, and uniformity and diversity.

The spirit of our Constitution applies to the federal government and Parliament and to the provinces. One example of its workings is the evidence of the self-restraint of majorities in the House of Commons. In a country as diverse as ours, with provinces differing widely in population and with two major linguistic communities, respect for minority interests is critical. In some circumstances, insistence on the rights of a simple majority in Parliament and in the country is a recipe for disunity. To bridge diverse interests requires leadership of an especially high order, genuine respect for minority interests, and the search for policies and goals that will unite, rather than divide, Canadians.

The Constitution has given our federal government certain broad powers to act within areas of provincial jurisdiction and even, it may be, to bring about *de facto* changes in the division of powers. The powers of reservation and disallowance, now by convention virtually "dead letters", were once actively employed. Commissioners recommend that these powers be finally interred through an appropriate constitutional amendment.

Through the declaratory power, the federal government may declare that certain works and undertakings within a province are for the general advantage of Canada or for the advantage of two or more provinces. Though it remains available, the declaratory power has not been used in recent years. Through what is known as the "spending power", the federal government can attach conditions to financial grants to governments, institutions and individuals or can assign the expenditure of large amounts of federal revenue to the provinces. The "Peace, Order, and good Government" clause (Constitution Act, 1867, s. 91) permits sweeping, if only temporary, federal involvement in areas that are otherwise subject to provincial jurisdiction. Each of these powers has been the subject of important controversies, and there have been proposals that they be either abolished or limited, perhaps by the courts, perhaps by some kind of mechanism for reaching provincial consent before they are used.

Commissioners believe that the declaratory power, the spending power, and the "Peace, Order, and good Government" clause are important and flexible devices for use in an uncertain world, and that the national government should retain them. Nonetheless, although we do not recommend formal limitations on their use, we consider these powers to have such potentially sweeping consequences for federalism that they must be exercised with special restraint, generally only after extensive discussion, and only when other federal powers provide no effective means through which government can act.

The spirit of the Constitution imposes equally important constraints on our provincial governments. Just as the federal government must tread cautiously when its activities affect provincial jurisdiction, so provinces must restrain their broad powers to spend, to engage in public ownership, or to tax, all of which can impinge on federal powers and on the interests of other governments. The provinces, too, must respect minorities. They must be sure that as they stimulate economic development, they do not impose excessive costs on the citizens and governments of other jurisdictions. This Commission has proposed some means to help ensure that this principle will be practised. Provincial adherence to such norms is all the more important as their functions have grown, and as they have claimed a right to help shape national policies. They, too, must take some responsibility for the whole institutional system of which they are a part.

The Division of Powers and Constitutional Flexibility

Commissioners' assessment of the institutions of federalism begins with the division of powers. Some critics have argued for a thorough rewriting of the division of powers set forth in the Constitution. Judicial interpretation and evolving practice have so shaped sections 91 and 92 of the Constitution Act, 1867 that they no longer provide a coherent guide to citizens or governments about the allocation of responsibility. The categories set out in those sections largely reflect mid-nineteenth-century attitudes towards government; they bear little relation to the functions of the state today or to the concepts and terminology of policy discussion. The areas of *de facto* concurrent federal-provincial jurisdiction have multiplied far beyond the formally designated fields of immigration, agriculture and pensions. This evolution of the division of powers, some would argue, has contributed to a Constitution that acts as a very weak disciplinarian of governments; in fact, say such critics, our Constitution has become highly permissive, offering a large number of "pegs" on which governments can hang almost any action they wish to justify.

Why not, then, modernize the division of powers to reflect more accurately the ways Canadians think about government today? There are several reasons why Commissioners do not make such a proposal. First, the Constitution, along with subsequent judicial interpretations, should serve not only as a guide to future action, but also as a record of our national past. It should force Canadians to rethink the lessons of former years. An evolving constitution reflects the movement of a complex society through time. It is not a continuous process of writing on blank slates. To rewrite *de novo* would be to erase the record of our collective experience and the lessons it contains.

Secondly, we see as a virtue the permissiveness and uncertainty of our Constitution. Our "living Constitution" gives us a great deal of flexibility in adapting to new concerns and needs. The importance of this freedom is obvious when one considers how difficult it is to modernize and clarify the division of powers. Just to codify past judicial decisions into a statement representing the current situation would be a massive – and controversial – task. Moreover, none of the broad distinctions that one might think of to guide a fundamental revision appears easily applicable in an age of interwoven policy areas. Distinctions between social and economic policy or between national and local considerations often seem arbitrary. In everyday experience, changes in technology and communications and new patterns of thinking influence us constantly. It is not easy to make precise distinctions in our complex age.

Another reason for hesitation about comprehensive constitutional revision is that any reallocation of the full range of constitutional powers to accord with current concepts of government would probably become obsolete almost the day it was put in writing. Rather than gaining certainty and clarity, we might, instead, experience a long period of even greater uncertainty while we worked out the full meaning of new concepts and phrases. Indeed, we are now witnessing a process of this nature with respect to Canada's Charter of Rights.

The obvious increase in the number of areas of shared jurisdiction has not so blurred the division of responsibilities between governments as to make meaningless sections 91 and 92 of the Constitution Act, 1982. While "grey" areas abound, the headings of the Act do set out the different functions of each order of government. A broad set of powers, together with access to the national rostrum that Parliament provides, enables our federal government to speak for all Canadians as citizens of a national community, to express our national will, and to concern itself with relations among citizens and regions.

Our federal government lacks unlimited power to act wherever it sees fit, since it is disciplined by the Constitution. Potentially sweeping federal powers, such as "Peace, Order, and good Government" and the "Trade and Commerce" power might have curtailed much provincial activity if they had been broadly defined, but the judiciary sharply constrained them. Certainly, a much broader trade and commerce power in the U.S. Constitution has led to greater centralization. Because of the discipline imposed by the Canadian Constitution, federal representatives, in pursuing national goals, often need the co-operation of provinces, which undertake direct action in many of these domains. The division of powers, though introducing an element of complication, illustrates that the federal government has a responsibility and an orientation to the national interest quite different from the responsibilities of individual provinces.

The provinces, too, have many economic, social and cultural powers that impinge on national policy. Section 92 of the Constitution Act, 1867 gives them wide authority to provide local services and to regulate relations among individuals and groups. Moreover, the provinces possess important land and property rights. Thus provincial actions can have major effects on national policy.

As we have seen, there have been challenges to the current allocation of powers. Throughout the 1970s, various provincial governments called for an extension of their jurisdiction in many areas; for limitations on a variety of federal discretionary powers; and for direct provincial participation in a number of fields of national policy making, especially those with major regional implications. These initiatives reflected the desire of many provinces to exercise greater control over their own economic and social development. In addition, some asserted that the voting power of central Canada and unbalanced representation in federal cabinets and governing parties led to federal policies unfair or unresponsive to the interests of the smaller provinces. These provinces therefore sought to counteract policies harmful to their interests, and demanded a voice in preventing them. Commissioners do not believe that the call for general decentralization of, or strong limitations on, federal powers is warranted. The present division of powers does not unduly hamper provinces in meeting the needs of their populations. Nevertheless, to the extent that the federal government has wielded its powers in ways unresponsive to the interests of some regions, Canadians must reform the processes and structures of the national institutions and improve intergovernmental institutional arrangements.

Representatives of the alternative view argue that the present constitutional arrangement unduly hampers the federal government's ability to pursue the national interest, and that our national government might require still greater powers. Again, this Commission does not believe that such a view is warranted: in most respects, the constitutional authority of our federal government is adequate. Provincial powers do not hamstring Ottawa's ability to respond to problems. Thus we Commissioners do not find, on the basis of our examination of the economic union and of policy management in the federal system, any compelling case either for significantly increasing centralization or for promoting decentralization. We see no merit in efforts to restore the classic model of "watertight compartments". In any event, such an enterprise would be doomed to failure. Certainly, disentanglement in specific areas might reduce confusion and the costs of decision making; generally speaking, however, overlapping of authority and *de facto* concurrence are not only inevitable, but also desirable. Shared responsibility opens up the possibility that the federal and provincial governments might compete to respond to citizens' problems. In this competition, the need to win popular support can temper the self-interest of governments. This assessment, however, does not deny the need for change and clarification of responsibility. It might well be to the advantage of Canadians to find ways to shift governmental powers back and forth in a more flexible fashion between provincial and federal governments. We recommend two possible methods of doing so.

The first method would be to amend our Constitution to permit legislative, as well as administrative, delegation of powers from one order of government to the other. Delegation of legislative powers has both critics and defenders. Its major advantage is flexibility. Responsibility for a particular matter might be transferred from one level of government to another without constitutional amendment. For any given issue, it is not necessary, however, to transfer responsibility to or from *all* provinces. This leeway makes our constitutional system even more flexible. Legislative delegation also permits *de facto* consolidation of responsibilities for certain matters or activities which might otherwise have to be regulated under several constitutional powers by both levels of government. In addition, it offers some greater measure of certainty to private actors who, in some circumstances, might come under conflicting regulatory requirements.

Critics argue that legislative delegation would undermine the constitutional distribution of powers and promote governmental uncertainty, confusion and diminished accountability. They argue that such delegation might threaten federalism by opening the possibility of massive centralization or, alternatively, of drift towards highly decentralized confederalism. It is argued that powers, once delegated, would be impossible to recover.

Commissioners are sensitive to the existence of risks and benefits, but on balance, we consider that in practical terms, the federation would benefit from the possibility of legislative delegation. We do not, however, envisage such active resort to this procedure that the constitutional balance would be eroded. Under the present Constitution, governments may delegate administrative responsibilities to administrative bodies established by other levels of government. Commissioners propose expansion of the power of intergovernmental delegation to allow one jurisdiction to delegate law making authority over a particular matter to another jurisdiction. The legislatures of the jurisdictions concerned should consent to such delegations in advance. These transfers of authority might be for defined periods or for periods of indefinite duration; they might take place between the federal government and one, all or a few provinces.

The second method for transfer of responsibilities is the intergovernmental accord. The concept of an accord as an agreement with special status has only recently been made part of our federal practice, and at present it has no clear legal or constitutional status. Intergovernmental agreements, contractual or informal, have a long history; such arrangements include the Tax Collection Agreements, shared-cost programs, the General Development Agreements, and the Economic and Regional Development Agreements. There have been numerous interprovincial agreements as well. They have been a useful means of combining flexibility and a greater measure of certainty about intergovernmental matters.

The term "accord" appears to go beyond such agreements. An accord and the language associated with it seem to have some of the characteristics of a treaty and to imply some form of special standing. An accord is not a constitutional amendment, but it is more than a simple administrative agreement which any government could change unilaterally because of the doctrine of parliamentary sovereignty which prohibits one administration from binding its successors. An accord is more than an agreement backed by legislation, which a legislature could repudiate. The 1985 Atlantic Accord drawn up between the federal government and Newfoundland to provide for joint management of offshore resources and the sharing of revenues argues for clarifying both law-making delegation and accords between governments. It involves a significant shift of power and responsibility to the province and to a joint board. However, the new decision-making body is to apply existing federal resource-management legislation to the extent compatible with the

Accord. Because there is no constitutional power to delegate legislative authority, both the province and the federal government must pass "mutual and parallel" legislation to implement the scheme, and thereafter each must pass any amending legislation in identical form. The Accord provides that neither government will amend the legislation or regulations implementing the Accord without the consent of the other. This restriction on parliamentary and legislative freedom is not constitutionally valid. For this reason, the parties have provided for the possibility of entrenching the Accord in the Constitution itself if the Government of Newfoundland should obtain the requisite support from other provinces.

Accords raise a number of questions for the future. Have we here a new status for certain agreements between governments that might prove more flexible than formal constitutional amendment? Could governments use such agreements to set up temporary arrangements and procedures not capable of unilateral repudiation? Could terms be specified in a more detailed manner than would be suitable in the Constitution, but with comparable stability? Would such agreements be more easily modified in light of experience, but in the meantime provide greater certainty for all concerned? And if the answer to these questions is yes, should we give accords clearer legal status and enforceability? We conclude that we should, and we recommend an amendment to the constitution to permit such agreements and to give them legal standing. Intergovernmental agreements made pursuant to the amendment could not be terminated by any government or its legislature alone. The consent of all parties to the agreement would be required. In effect, for the term of the agreement (if specified), Parliament and the legislatures involved would be constitutionally permitted to bind their successors.

Constitutional Amendment

In the long term, amendment of the Constitution will remain an important device for adaptation of the federal system to new requirements. At the time of Confederation, Canada's Constitution contained no general procedure for amendment. In 1949, the federal government received the power to amend the Constitution in some areas that lay within federal jurisdiction, exclusive of changes affecting the division of powers, the Senate and other critical provisions. This gap in Canada's constitutional machinery has been politically embarrassing and had unfortunate practical consequences. Despite numerous attempts, however, Canadians did not acquire a general amending formula until 1982. Before that date, proposals for constitutional change always involved endless disagreement about methods of achieving them.

Now the rules are clear, if complex. Our new amending formula contains "provincialist" elements which represent the compromise required to forge constitutional agreement in 1981: it treats all provinces equally, and it denies the two largest provinces the veto that many earlier formulae had incorporated. There is no explicitly regional requirement applicable to building the requisite degree of consent. Most substantive amendments require the assent of the House of Commons, the Senate and two-thirds (that is, seven) of our provinces, representing at least 50 per cent of the Canadian people. A few critical institutional matters, including changes to the amending formula, require unanimity. Amendments affecting some, but not all, provinces require the agreement of those involved. The most important form of protection for individual provinces is the opting-out provision: any province may decline to be bound by an amendment derogating from its powers or privileges. If an amendment affects education or other cultural matters, a province that chooses to opt out has the right to reasonable compensation.

A number of the new formula's features appear to make constitutional amendment easier to achieve: proposed amendments can now be initiated in any of 11 legislatures; amendment need no longer involve the complex "package deals" characteristic of past attempts. No province has a veto, and the Senate has only a suspensive veto. Despite these significant elements of flexibility, Commissioners do not expect frequent amendments. It remains relatively easy to construct a coalition large enough to block proposals. There is no provision for popular ratification to override the positions of governments. Most important, while opting-out may facilitate amendment even if some provinces object, we think that it will limit the frequency of change. Even if only one or two of the larger provinces opted out of any proposed amendment, the action could destroy the effect of any suggested change. More important, if provinces were to use the opting-out provision, the prospect of a "chequer-board Canada", where the operative Constitution varied from province to province, would loom large. We would expect any federal government to regard such a prospect with considerable misgiving and probably, indeed, to withhold consent if a pattern of opting out developed.

In practice, the new amending procedure may differ little from a requirement for unanimity. Constitutional amendment will probably occur only in non-controversial areas where a high degree of consensus has developed. However, Commissioners expect considerable reliance on the rich variety of other institutional devices available to Canadians; in particular, our governments are likely to use formal and informal agreements and delegation. Indeed, it is, in part, because we foresee this growing resort to these other instruments that we are led to recommend constitutional amendments to permit legislative delegation and binding intergovernmental accords. Such devices fill common substantive needs and "lower the stakes" of intergovernmental bargaining by allowing for renegotiation in light of experience.

A central element in any federal constitution is a final court of appeal to act as umpire of the system. Constitutional conflicts arise constantly. They may enter the judicial process through litigation initiated by citizens or private interests, or as a result of government actions, such as the reference procedure. Until 1949, Canada's umpire was the Judicial Committee of the Privy Council (JCPC) of the United Kingdom. Its interpretation of the British North America Act made Canada's Constitution far less centralized than the words of the Act seemed to imply. In 1949, however, the Supreme Court of Canada became our final court of appeal in constitutional matters. Its record since then demonstrates continuing sensitivity to the principles of federalism in the context of a changing society. In case after case, the Court has ensured the maintenance of a balanced federalism.

During the 1970s, heightened intergovernmental conflict greatly increased the volume and sensitivity of constitutional cases before the Supreme Court. On contentious matters such as energy, the Court's role was critical. Now, with the advent of our Charter of Rights, it may become even more so. There will be challenges to the actions of both orders of government, not only as to whether they have acted *ultra vires*, but as to whether they have violated the Charter. These considerations have led observers to suggest that the Court should be accorded a more explicit constitutional status, and that the procedures for the appointment of judges should be re-assessed in light of the court's enhanced constitutional role. We shall address these issues later in this Report.

Although judicial decisions may clarify the limits of constitutional jurisdiction within our federation, and although delegation of powers, accords and other arrangements may help to define governmental responsibilities, nevertheless federal-provincial and interprovincial relations will remain central to adaptation of the federal system. Accordingly, Commissioners turn to the structures and processes of intergovernmental relations in Canada.

The Machinery of Intergovernmental Relations

The machinery of intergovernmental relations helps to manage the complex linkages among the governments of Canada as each level of government operates across many policy areas and deploys a wide range of governing instruments, including spending, taxing and regulating. Subject to the limits of the division of powers, and given always the potential of the Supreme Court to act as final arbiter, the activities of federal and provincial governments are interwoven in many policy fields. Constant interaction is required as leaders at each level respond to the changing demands of citizens in an evolving economic and social context. The challenge, then, is for Canadians to design intergovernmental machinery for managing this interdependence and to do so without sacrificing our other political values.

It should be clear from the previous pages that Commissioners do not intend to suggest that the ideal or the primary goal that Canadians should seek in a reformed set of intergovernmental processes is continuous harmony and the avoidance of all conflict and controversy. We should expect – and we shall continue to have – a great deal of competition within the consultative forums of the federal system. The federal government, concerned with the whole country and serving a nation-wide electorate, will differ in policy matters from provinces serving more limited constituencies. Inevitably, governments will compete to gain the credit for distributing the pleasant policies and try to pass on the blame for the painful ones. Inevitably, different provincial governments will reflect the different needs arising from their particular economic structure and the social make-up of their jurisdictions. The democratic process in the federation involves competition for public support as governments try to produce the policies their constituents demand. The challenge is to ensure that competition does not impose excessive and disproportionate costs on other jurisdictions, that it is carried out in such a way that the interests of citizens play the foremost part in shaping its outcome, and that the credibility of the institutions of federalism is not undermined. Indeed, while co-ordination is the desired result, the process of achieving it is often competitive and adversarial.

Commissioners do not desire governments within the federation to act jointly in every undertaking, binding one another to the lowest common denominator. Such a policy would deprive federalism of one of its major virtues: the opportunity to use diversity to advantage and to reap the rewards of flexibility and experiment. Total unanimity would be a recipe for paralysis and immobility. It would also clash with the principle of Cabinet responsibility, which makes each government answerable, through its legislature, to its own electorate.

Intergovernmental relations in the federal system involve several levels of interaction. At one end of the continuum, policy making is completely independent: governments take action without consulting others or considering their interests. Under this arrangement, other jurisdictions must adjust independently. A significant portion of federal and provincial policy making takes this form. Governments are, and should be, free to act autonomously within their own jurisdiction. When their policies have a major effect on other governments, however, interdependence requires explicit attention to the interests of others.

The second level of interaction is characterized by consultation. On this level, each government recognizes the effect of its actions on other jurisdictions and the fact that all are acting in the same areas and/or in closely related areas. Here it is important to provide the means for governments to keep one another informed and to provide opportunities for persuasion, pressure and influence. In an interdependent federation, areas of common action represent a large and recently growing category. Accordingly, the institutions which this Commission proposes are designed to encourage close and continuous consultation across a wide range of policy areas. Commissioners believe that governments in a federal system must strive for "a mutual comity which never overlooks advance notice and consultation [and] always strives for accommodation. This is just a necessity for a genuine working federal system in a developed country in the late twentieth century."[1]

The third level of intergovernmental relations involves efforts to achieve co-ordination. Here, governments will try to develop commonly acceptable policies and objectives which they will then implement within their own jurisdiction. The co-ordination of activities can take place in several ways. These ways can range from the general search for a common economic policy framework at a First Ministers' Conference, to detailed agreements on how federal and provincial policies will mesh in a particular province, as in the Economic and Regional Development Agreements.

Finally, there is joint decision making, which requires that federal and provincial governments act together, committing themselves to particular courses of action and standards of conduct. Shared-cost arrangements take this form. It is in this context that fears arise that the accountability of responsible governments will be sacrificed to the need for intergovernmenal consensus. We Commissioners share these fears, and we have taken them into account in making our suggestions for reform of intergovernmental relations.

Each one of these kinds of governmental interaction is exemplified in the vast network of relationships which have developed since the end of the Second World War, especially in the 1960s and 1970s. The "set-piece" First Ministers' Conference (FMC) provides the most obvious example. There are also many ministerial-level meetings on a wide range of subjects and even larger numbers of joint committees of officials. In addition to meetings of all 11 governments, there are hundreds, if not thousands, of bilateral meetings, or meetings between the federal government and groups of provinces. Interprovincial conferences have come to be of significant use, both in co-ordinating provincial responses to federal initiatives and – with less success – in harmonizing provincial policies. In addition to all these formal meetings, myriad informal contacts are made.

There has been considerable variation in the relations between the federal government and individual provinces. Canada has created an intricate network of intergovernmental relationships through which to manage interdependence, though these arrangements are nowhere mentioned in the Constitution and have almost no legislative base. This intergovernmental "industry" has been criticized on many grounds. To some observers, it constitutes a "third order of government", threatening to undermine the principles of parliamentary accountability. Other observers believe that the intergovernmental process introduces important biases into the consideration of public policy in Canada. They consider that the process focuses undue attention on the "second-order" questions of political status or on competition between levels of government rather than between parties, to gain credit among voters and to avoid blame. It is sometimes argued that in emphasizing the role of provincial governments, the intergovernmental process reinforces a tendency to define the regional dimensions of issues in terms of provinces, conveying the impression of homogeneity within provinces when, in fact, there are often as many differences within provincial jurisdictions as there are among them. The process also diverts attention from other problems, such as those relating to socio-economic status or gender, and reduces the opportunity for groups who represent such non-regional interests to mobilize and to secure a hearing. There is doubtless some truth in this view: the focus in intergovernmental discussions of economic policy differs from that chosen in discussions between the public and private sectors. This is an inevitable consequence of a federal system, but the difficulties should not be exaggerated. Intergovernmental discussions do take into account concerns expressed in the wider environment. When the public agenda emphasizes issues in which regional differences are slight, as in the construction of the post-war welfare state, the debates among governments can reflect that wider concern. Finally, federal or provincial Ministers and officials negotiating on specific matters frequently represent the interests of their client groups.

Another set of criticisms relates to the intergovernmental process itself. While there is considerable communication among governments, it is often sporadic and *ad hoc*. Governments naturally tend to call for consultations when it is to their political advantage; they are equally likely to ignore inconvenient calls. There has thus been no assurance that ongoing common problems will receive continuous attention. Even the issue of calling meetings, especially First Ministers' meetings, has tended to be a matter of political debate which diverts efforts from the actual search for solutions to common problems. The public meetings, especially at the level of First Ministers, seem to put a premium on the strongest possible statements of position, rather than on a search for understanding and compromise. The process exposes differences more effectively than it contributes to their reconciliation.

In recent years, the intergovernmental process has been further hampered by the divergent expectations of participants. Provinces have tended to regard First Ministers' Conferences as opportunities to discuss the full range of federal policies and to assert an influence in national decision making. This tendency has been fostered by three developments. Provincial governments' growing strength and effectiveness permit them a claim to affect national policy and give many of them levels of expertise and knowledge equal, in certain fields, to that of the federal government. In the recent past, the weak representation in certain regions of the party in power has lent credibility to the provincial claim to represent these areas, even in national policy. Changes in the federal government's approach to managing our economy, have increased federal involvement in areas previously considered primarily provincial. Federal-provincial conflict tends to be more intense when governments are searching for new policy options in previously uncharted areas.

The federal government, on the other hand, has viewed First Ministers' Conferences on the economy as a mechanism for consultation on a wide range of issues. There have been occasional attempts at co-ordination, but it is probably fair to say that the federal government has resisted provincial suggestions to formalize a decision-making process on the basis of "executive federalism" primarily on the grounds that this would not fit well with the role of parliament in our system of responsible government. While the federal government acknowledges the helpfulness of provincial government views on national economic policy making, provinces have rarely welcomed the federal government's views on provincial policy or programs. Furthermore provincial governments have been reluctant to put forward views on how they might alter provincial policies to contribute to the resolution of fundamental country-wide problems. This imbalance in obligations at the First Ministers' table has led some observers to question what co-operative federalism really means.

Government growth has caused structural changes which have seriously affected intergovernmental relations. The role of "central agencies" and institutions, such as premiers' offices and Treasury Boards, has expanded as governments have sought means to achieve greater consistency and co-ordination in their operations. More centralized direction and attempts to establish greater fiscal and policy control over line ministries have been part of governments' efforts to identify and pursue more "global" or integrated visions of the public good. To some extent, these efforts have weakened an earlier pattern in which intergovernmental relations were mainly conducted among ministers and officials in operating departments with a specific policy mandate. Federal and provincial officials within such departments often shared common policy and professional goals, and responded to the same groups in the population. Their common interests and activities fostered mutual trust and a sense of common purpose. At the First Ministers' level and within central agencies, the goals of political status are likely to be more prominent, and governments are likely to be less constrained by group pressure. The goal of co-ordinating policy across all fields within a single government often conflicts with management of intergovernmental co-ordination within a policy area.[2]

In such recent issues as that relating to the Constitution, the status of governments has also caused intergovernmental tension. Constitutional reform dominated the intergovernmental process for much of the period from 1968 to 1983; it was fuelled both by Quebec's wish for an enhanced status and by the West's desire for a new deal. Debate on the Constitution called directly into question the status and powers of government. The questions it raised were powerful and symbolic, not easily subject to the kind of "splitting-the-difference" compromises characteristic of more concrete and less emotionally charged issues. Since the purpose of the participating officials was to defend their government's vision of Confederation, there were fewer ties of common interest. The general absence from the process of well-informed interest groups meant that no one held the participants accountable or encouraged resolution of differences. In short, debate on the Constitution brought out the worst features of the intergovernmental process. While more co-operative relationships existed in many areas, battles over constitutional and energy issues tended to poison the whole range of intergovernmental relationships, turning the process into one of "good guys" versus "bad guys".

The foregoing assessment might suggest that the machinery of intergovernmental relations is so cumbersome and ineffective that it is beyond effective reform. Commissioners disagree. We must provide intergovernmental institutions to meet the need for co-ordination in several major fields where federal and provincial government actions and responsibilities overlap. Therefore the institutional arrangements which we propose are intended to consolidate the existing intergovernmental structure. Our aim is not to multiply intergovernmental bodies, but to make effective the machinery Canada already has in place. We hope to ensure that actions which may seriously affect other levels of government will be assessed in advance and will increase the openness of intergovernmental relationships, rather than introduce new constraints and limits. We also believe that it is vital to ensure reform of the overall process to make it more consistent with basic norms of political accountability and to improve public access to, and understanding of, intergovernmental relations.

Commissioners wish to encourage institutions and processes that will facilitate common trust, for without some general understanding of shared purpose, the best-designed institutions will fail. But shared purposes alone are not enough to establish positive relationships: they need to be supported by effective consultation and debate if co-ordinated results are to emerge. The constructive elements will arise from co-operation and recognition of the legitimacy of differences.

Proposals

Commissioners therefore propose that the First Ministers' Conference (FMC) be entrenched in the Constitution. First Ministers should meet annually on a fixed date, and other sessions should be called as necessary. The First Ministers' Conference is the capstone of the intergovernmental structure.

Throughout the recent constitutional debates there was discussion concerning a regular First Ministers' Conference. The FMC has been a major goal of most provinces, and at times, the federal government endorsed their aim. At the First Ministers' Conference held at Regina in February 1985, Prime Minister Mulroney committed his government to annual meetings on the economy for the next five years. Some might object to institutionalization of this most contentious federal-provincial body, where political differences predominate. Commissioners believe, however, that official status for the FMC would acknowledge the need to arrange a satisfactory forum of interdependence, and for federal and provincial governments to co-ordinate policies and activities. To ensure openness and accountability, some FMC sessions should be held in public, though private discussions should take place as necessary. To make the meetings fixed and regular would remove one of the more contentious aspects of recent FMCs: the arguments about when and whether one should be called. To a great extent, regular Conferences will avoid the build-up of hostilities and the artificial inflation of governmental and public expectations that result from such jousting.

The central purpose of FMCs should be to provide a forum where federal and provincial leaders can discuss policy needs and explore possibilities for action of national importance in both levels of jurisdiction. The FMC would not be a legislative body, and its decisions would not be binding on governments. Rather than legislate, it would seek a common policy framework. Formal voting rules, as such, would not be necessary. Legislative follow-up to discussions in the FMC and in the other bodies Commissioners suggest would be the responsibility of governments.

Nevertheless, the FMC would need to organize its own affairs. Commissioners envisage creation of additional Ministerial Councils, a step which we propose below. The FMC could restructure the Councils as necessary, define their mandates, assign them tasks, and receive their reports. It might wish to establish a voting rule to cover decisions about the structure, composition and mandates of Ministerial Councils.

Critical to the success of any intergovernmental institution is adequate preparation. This includes extensive prior discussion of the agenda, sharing of information, and private exploration of possible areas for agreement or compromise. The FMC could create an independent secretariat to support preparatory work, perhaps by upgrading the Canadian Intergovernmental Conference Secretariat, which now provides administrative services. This move would introduce into the system a group of officials whose objective would be the success of the system itself. Conversely, it would create some difficulties. An autonomous intergovernmental bureaucracy similar to the Commission of the European Community, for example, would be counter to

Canadian norms of responsible government. Commissioners therefore recommend the use of a better-established Canadian institution: a permanent committee of senior officials like the Continuing Committee of Officials on Economic Matters. Such a committee, with members designated by the First Ministers, should be appointed to support the FMC.

Although Commissioners have rejected the option of an independent secretariat to serve the FMC directly, third parties, not tied to the day-to-day interests of governments, can often help to facilitate agreements, by providing optional perspectives and new information, and by finding solutions that participants may be too involved to see. An Advisory Panel on Intergovernmental Relations might fulfil these functions and help the public to understand federal-provincial issues. We have looked at two models: the long-established Advisory Commission on Intergovernmental Relations (ACIR) in the United States, and Australia's Advisory Commission on Intergovernmental Relations. These commissions, established by legislation, consist of representatives of the federal and state governments (and, in the United States, of municipal governments), served by a small professional staff. In each country, the Commission studies various issues, conducts research and holds conferences. Their work has made notable contributions to good intergovernmental relations.

Members of such a commission or panel could act as informal mediators to help resolve conflict among governments. The techniques of mediation, developed in settings from labour/management relations to great-power negotiations, might help to resolve intergovernmental conflict in Canada. An advisory group could ease those relations behind the scenes, and provide information and analysis both to governments and to the public. First Ministers might eventually wish to consider the creation of such a body to assist in providing some or all of the possible contributions we have noted. Commissioners would suggest, however, that this additional element be considered only after some experience has been gained with the new structures and procedures we are recommending for the FMC and Councils.

Meetings at the ministerial level now cover many areas of government policy, but they, too, suffer to some degree from their sporadic nature. With some exceptions, notably the meetings of Finance Ministers, they do not provide continuous interaction and sharing of ideas and information. Commissioners recommend strengthening these relationships as part of our larger purpose of increasing the emphasis on concrete policy problems. This shift of focus is much more likely to occur in groups created to concentrate on specific problems. We therefore propose that the First Ministers' Conference appoint a number of Councils of Ministers to serve in major functional policy areas. Again, the meetings of Ministerial Councils should be held regularly, presumably more frequently than FMCs, to encourage development of common perspectives and exchange of information, and to establish trust among the participants. Like the FMC, Ministerial Councils would be served by continuing committees of officials. This Commission does not propose to list all the Councils that might be established or that already exist in some fashion. Our purpose is to suggest a core framework of federal-provincial mechanisms that would, in a more streamlined way, support First Ministers in their collective and individual responsibilities. Commissioners propose that three central Ministerial Councils be established in the fields of Finance, Economic Development and Social Policy, areas related to major themes developed earlier in this Report.

The Council of Ministers of Finance

The Council of Ministers of Finance (or the Conference of Finance Ministers) stands as Commissioners' prototype for the other councils. Finance Ministers and Treasurers have met regularly for many years to monitor and negotiate fiscal arrangements, to discuss economic projections, to compare notes before budgets are prepared, and to discuss macro-economic policy. Our proposal simply formalizes the existence of the ministerial Council on Finance and requires, again, that it meet more frequently. Furthermore, its importance would be enhanced by our proposals for greater federal-provincial co-ordination in the budgetary process. This Council, as we discuss in the section on fiscal arrangements, would be supported by a new federal-provincial body of tax experts, the Tax Structure Committee, to conduct research and monitor developments in taxation.

The Council of Ministers Responsible for Economic Development

As Commissioners mentioned earlier, protection of the Canadian economic union is not simply a matter of preventing the erection of barriers or of finding the right enforcement officer. Rather, successful operation of the economic union requires that Canadian governments build a common set of purposes that will lead to co-ordinated effort in all the economic development activities in which governments engage. A Ministerial Council for Economic Development would provide the principal focus for discussion of such purposes and means to achieve them.

The successful operation of Canada's economic union also requires exchange of information among governments in order to prevent, especially at an early stage, the escalation of policies that are harmful to other jurisdictions. The Council of Ministers responsible for Economic Development would therefore monitor and assess the state of our Canadian economic union. Through the Council, governments might develop "a Code of Economic Conduct", as described above. The Council would seek agreement on common objectives in economic and trade policies and would encourage mutually beneficial linkages among regions.

A vital adjunct to the Council would be a Federal-Provincial Commission on the Economic Union whose members would be named by the Council. The Commission would monitor the state of the Canadian economic union, conduct research to identify barriers and possible areas for greater harmonization, and report publicly to the Ministerial Council on these matters. It would also provide for official hearings of individuals and groups who believe that existing barriers significantly frustrate their own activities. It would investigate their complaints, weigh them against other considerations, and report both to the public and to the Council, offering recommendations for action.

Such a body would ensure public involvement in discussions of our economic union. It would also provide an independent source of advice aimed at strengthening the economic union. Moreover, by requiring governments to justify their actions publicly, it would increase their accountability. Commissioners anticipate that it would discover many areas in which differences in licensing standards and safety regulations neither serve distinct provincial or federal public purposes nor protect the public. Many, indeed, are simply the product of tradition, inertia and lack of awareness.

The Council of Ministers on Social Policy

The importance of social policy to many facets of Canadian life and the high degree of shared responsibility in the field of social policy strongly suggest the need for a Council of Ministers on Social Policy. Such a body could consider all facets of social policy, especially in the shared fields covered by the Established Programs Financing (EPF) and the Canada Assistance Plan (CAP). The recommendations on social policy set out earlier in this Report suggest a large number of reforms which will require intergovernmental consultation. Consultation with practising professionals and interested groups and individuals is particularly important in this area. Commissioners would encourage Parliamentary Committees to take a more active part in forming social policy, conducting research on the issues involved, and holding public hearings.

The FMC could establish other ministerial councils as necessary. It might, for example, appoint councils in such areas as employment training and the administration of justice. These structures would provide a framework for greater coherence in the federal-provincial system. Less structured forms of interaction would also occur automatically, in bilateral and interprovincial discussions of specific issues. Indeed, as we have noted, many such relationships already exist, and we see no reason why this process should not continue to evolve.

Throughout this Report, Commissioners have stressed the need to make governments more accountable to legislatures and voters. We have noted that the intergovernmental processes of executive federalism can sometimes undermine clear lines of accountability. We need continuous effort to minimize this tendency. Moreover, the intergovernmental process must be kept open to public view. Some of the proposals made above will assist this process. For example, the Federal-Provincial Commission on the Economic Union, in assessing complaints, will provide a public window. The proposals that the First Ministers' Conference be open, at least in part, will facilitate the same objective: governments will be accountable for their performance. If more functional and substantive discussion takes place between governments, participants should become more aware of the interests of affected groups.

This Commission, however, believes that even more could be done. Governments must be held accountable for their conduct of intergovernmental affairs. The best way to hold them accountable is through a parliamentary or legislative committee. In recent years, the Task Force on Federal-Provincial Fiscal Arrangements (the Breau Task Force), parliamentary committees on the Constitution, and similar provincial bodies have demonstrated the value of parliamentary scrutiny of intergovernmental matters. All tempered the tendency of intergovernmental forums to focus on "who does what" with a healthy emphasis on what is to be done. Standing committees at both levels would be able to monitor these relationships more consistently. Commissioners therefore propose that Parliament and the legislatures establish permanent standing committees responsible for intergovernmental relations.

Interprovincial Harmonization

So far, Commissioners have concentrated on the federal-provincial dimension of intergovernmental relations. There are many interprovincial relationships and some important interprovincial institutions. Since the early 1960s, leaders of Canada's provincial governments have met annually in the Premiers' Conference. These meetings at first concentrated primarily on co-ordinating approaches to issues of provincial concern. More recently their aim has been to unite provinces in their response to federal initiatives, especially in relation to fiscal and constitutional matters. On a few occasions, provinces have forged compromises among themselves in order to take up a common position. The office of Conference chairperson rotates among the premiers; the incumbent often speaks for the provinces in dealings with the federal government. Provincial agreements are likely to affect federal-provincial relations, particularly on issues where provinces share common policy interests, mainly those, like the Constitution, that relate to their status as governments. On other economic and social questions, different regional needs and interests will often divide provinces as much as they do federal and provincial governments. Provinces will often wish to deal individually with the federal government, rather than as part of a group.

Within an economic union, harmonization of policies across jurisdictions is vital.[3] As we have seen, differences in product standards, licensing rules for occupations, and codes of commercial law can inhibit mobility and trade among member jurisdictions. It is necessary to seek a balance between the autonomy of member-states to enact policies to suit their own conditions and the uniformity that facilitates transactions among them.

In a federal system like Canada's, the federal government properly plays a central role in harmonization. This is why constitutional authority over interprovincial trade and commerce is federal, and why Commissioners believe that fields like competition, telecommunications and product standards should be primarily federal matters. The proposed Code of Economic Conduct is also a step toward harmonization. It is aimed at ensuring that federal and provincial economic-development activities do not erect barriers to the Canadian economic union.

There remains, however, a large domain of provincial regulatory activities derived mainly from provincial authority over property and civil rights. These activities can lead to variations in practice among provinces that inconvenience economic actors wishing to operate on a national plane. Where varying provincial laws create difficulties, transfer of responsibility to the centre is not the only possible response. An alternative device encourages provinces to harmonize their laws as much as possible, where this is necessary for the effective integration of the Canadian market. Much harmonization, of course, occurs spontaneously: all provinces are under similar pressures from constituents, and their policies are unlikely to vary much. As a government prepares to act in a field, it is natural for it to look first at the ways others have drafted their legislation. Innovations begun in one province can thus spread to others.

Canadians should also ask what mechanisms exist to promote more complete harmonization. The oldest such mechanism is the Uniform Law Conference of Canada, formerly the Conference of Commissioners on Uniform Law, founded in 1915. Its membership, which meets annually, includes representatives from the federal government, all the provinces and the territories. It has published more than sixty uniform acts in many fields. Twenty-four have been accepted in six or more jurisdictions, but only one has ever been adopted in all jurisdictions. There are many explanations for the modesty of this record. The Conference has a small secretariat and few research resources. Its members are all full-time officials employed elsewhere. The focus on drafting uniform laws has diverted attention from concentration on broad principles. The draft laws, developed in the common-law tradition, have met with little response in Quebec, with its Civil Code tradition. The Conference has done little to enlist outside groups in its work or to lobby for the adoption of its proposals.

A different mechanism for fostering harmonization is the formation of ministerial or official working groups. One such institution in Canada is the Council of Ministers of Education, which is intended to promote better exchange of information and development of common curricula. More narrowly focused committees have also had success. These include, for example, a federal-provincial group working on a central registry for security interests in aircraft, which was established in 1983.

Efforts at harmonization require strong pressure from outside, as when groups inconvenienced by provincial variations mobilize to promote unity. Federal and provincial law-reform commissions could exert such pressure. It would be relatively simple to extend their mandates to include responsibility for examining possibilities for interprovincial harmonization, although so far there has been little movement in this direction. Another important vehicle is professional groups with a nation-wide mandate, such as the Canadian Bar Association or the Canadian Institute of Chartered Accountants. In 1963, the Commercial Law Section of the Canadian Bar Association created a committee of experts to prepare a model Uniform Personal Property Security Act. The Committee has been influential in modernizing and harmonizing law in this area which is vital for interprovincial business transactions. At least seven provinces have passed, or are likely to pass, legislation embodying most of the features of the model law.

What are the lessons of this record of interprovincial harmonization? The evident lack of drive behind these efforts could have several meanings.

Perhaps there is already a significant degree of harmonization; perhaps existing gaps in harmonization pose relatively few costs; perhaps there is a great unfulfilled need for new institutions. Commissioners incline to the first two explanations. Overall, however, we believe that greater harmonization would maximize the advantages of the economic union. We do not recommend creation of additional institutional structures: the institutions we have described already should prove ample. Thus, the Council of Ministers for Economic Development will undoubtedly address interprovincial harmonization, as will the Federal-Provincial Commission on the Economic Union. The latter provides an opportunity for private actors to press for improved harmonization in particular areas. Similarly, the other ministerial councils can commission working groups to examine harmonization. The Premiers' Conference could look at the issue, delegating specific tasks to ministers or officials. Thus, mechanisms exist to respond to needs as they develop.

Conclusions

Commissioners have designed these proposals to rationalize the structure of intergovernmental relations. We wish to facilitate management of interdependence in the federal system, for Canadians cannot recreate the classic watertight compartments of federalism. We have made a number of suggestions for disentangling federal and provincial activities, such as a clearer division of labour in regional development policy and replacement of the Canada Assistance Plan by a federally operated income-supplementation scheme to which provinces would add their own programs. We believe that as the Councils of Ministers look at other programs, they can accomplish much more in terms of understanding and clarifying which government should implement which programs.

Commissioners have recommended some constitutional changes and have emphasized the need for more flexible procedures to promote delegation and intergovernmental agreements. There will remain many intergovernmental relationships arising from shared responsibilities and the need to adjust policy to changing needs. We Canadians can gain much by rationalizing the structure that already exists and by providing more effective forums for consultation and co-ordination. Commissioners' proposals should provide for more consultation and for mechanisms to ensure that this consultation is open to public scrutiny.

We Commissioners urge Canadians to consider our proposals for reform of intergovernmental arrangements in relation to our other recommendations for institutional change, especially those pertaining to the reform of national institutions. The federal government, in the conduct of its responsibilities, must possess the capacity to represent and accommodate the interests of all regions: intergovernmental relations are not a substitute for full regional representation at the centre. Similarly, enhanced regional representation in national institutions is not a substitute for intergovernmental relations. The existence of a formal division of powers and of two strong orders of government means that co-ordination is essential, no matter how regional representation in national institutions is achieved. Thus we see reform of the centre and reform of the institutions of the federation not as alternatives, but as complementary: Canada needs not merely one or the other, but both, for different purposes.

Reform of national institutions along the lines Commissioners have proposed should change the character and dynamics of federal-provincial relations. Stronger representation from all provinces in national institutions will ensure that regional concerns will be represented in caucus and Cabinet. Moreover, through its Members of Parliament, a more regionally representative government should be able to communicate effectively with citizens in each province, in developing support for programs and initiatives and in responding to local needs. Such a government will be able to provide more effective leadership and to counter the claim that the provincial governments are Canadians' only legitimate representatives of local interests. One consequence of the present regionally imbalanced structure of representation in national institutions has been the almost impossible burden it placed on the intergovernmental process. A lesson of the recent past is that political integration comprises too large a task to be discharged by a single set of institutions. A healthy federal system is one in which there are multiple links binding together federal and provincial levels. These links exist, not just between governments, but in political parties, in bureaucracies, in the media, in associations of all kinds and, ultimately, in the minds of citizens.

Commissioners do not wish to conclude this discussion of intergovernmental relations without noting the profound importance of personal associations in social, commercial and family life that link Canadians in different parts of the country. In a federal society, the informal ties of citizens to one another, as well as to the state, are important means of moderating or restraining excesses. Communication across regions moderates tendencies to excessive differentiation; it also serves as the foundation for the tolerance of diversity which, in its turn, provides a healthy check on the unifying authority of the national government. Ultimately it is citizens who must discipline the conflicts among their governments.

CHAPTER 23

Citizens, Communities and the Federal State

Introduction: The Charter and Living Constitutionalism

The Canadian Charter of Rights and Freedoms and other provisions of the Constitution Act, 1982 involve the citizens and communities of Canada more fully in the constitutional order than they have previously been involved. Provisions of the Charter and the manner in which they are applied and interpreted by courts, legislatures and Canadians themselves will, in the years ahead, significantly alter relationships between our citizens and their governments. Canadians will take some time to adjust to the Charter. Commissioners' purpose in examining the Charter, therefore, is to make more widely known some of its possible implications. We wish to promote greater understanding and consideration of the problems and opportunities that arise from the Charter and in so doing, perhaps to assist in the process of adjustment. In this section of our Report, therefore, we Commissioners examine some of the ways in which we believe the Charter will affect Canadian politics and society in the future.

The Constitution Act, 1982 was the culmination of two years of intense negotiation and public discussion involving federal and provincial governments and many interested groups and persons across Canada. It was adopted after four years of almost continuous discussion, six years of prolonged crisis of national unity, fourteen years of sustained efforts to entrench the fundamental rights of citizens in the Constitution, and more than fifty years of search for an all-Canadian formula for constitutional amendment. When it emerged, the Constitution Act, 1982 was the product of this process: a compromise document reflecting both principle and pragmatism. It also signalled the beginning of a new era of Canadian constitutional history.

All the key actors in the constitutional reform process had a hand in shaping the Constitution Act, 1982. The signatures on the final accord were those of the First Ministers or their delegate. Parliament played a significant role in formulating the resolution discussed by the First Ministers. The people of Canada participated both through the public hearings of the Special Joint Committee of Parliament and through intense lobbying efforts at various stages of the Constitution Act's genesis. The Supreme Court of Canada's important constitutional decision of September 1981 rekindled discussions between the federal and provincial governments.

The Constitution Act, 1982, represents a constitutional reform package. It is impossible to understand or explain each provision without reference to the Act as a whole. A comprehensive procedure for amending the Constitution of Canada effectively crowns the achievement of Canadian sovereignty over our domestic Constitution. In addition, the Constitution Act, 1982 has added a Charter of Rights and Freedoms to the basic constitutional law of Canada.

New institutions may be created and constitutions written or amended in relatively short periods of time. Once in place however, the institutional and constitutional framework profoundly affects the manner in which future public issues emerge, as well as the way in which they are resolved. The words of every constitution betray the era in which they were written, and the Charter of Rights and Freedoms provides no exception. Our Charter was enacted in 1982. It therefore reflects many of the concerns of the social movements of the 1970s, as well as that decade's intense concern with national unity. In the matter of equality rights, for example, the Charter differs markedly from the Canadian Bill of Rights legislated 22 years earlier. Moreover, we cannot understand the Charter's provisions on language and personal mobility rights without reference to political events of the 1970s.

Just as the approach to human rights has changed significantly over the past few decades, it will undoubtedly change in the future. Shifts in the balance between individual rights and the interests of the community as a whole, new understandings of the causes of discrimination and the ways in which it operates, and new concerns about equality will come to our attention. As societies evolve, their composition, needs and aspirations change. As a society grows and changes, so too does its understanding of the need to protect human rights and of what these rights may entail. The Charter will help to shape this evolutionary process.

How does an entrenched charter or bill of rights interact with this process? An entrenched charter provides at least a minimum guarantee and secure base of citizens' rights, but it should also adapt to meet new social conditions and challenges. The balance is not unlike that required in any constitution that aspires to survive periods of tumultuous change. A number of provisions in the Canadian Charter of Rights and Freedoms point to the need to develop a Charter jurisprudence that is sensitive to such a balance. The first section of the Charter states clearly that the rights and freedoms it guarantees are subject "only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society." How the courts balance the rights guaranteed by the Charter with the needs of society will help to determine how the Charter contributes to the development of our "living" Constitution. The Constitution Act, 1982 itself contains certain principles that are fundamental to this process of development.

The Charter and Parliamentary Supremacy

The Constitution Act, 1982 declared for the first time that the Constitution "is the supreme law of Canada and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect."[1] As part of the Act, the Charter of Rights and Freedoms is the supreme law of the land. This guaranteed constitutional protection of rights and freedoms supports Commissioners' view that the Charter is a new pillar of the Canadian constitutional order. Its arrival has especially important implications for the tradition of parliamentary supremacy in Canada. Legislation of Parliament and of the provincial legislative assemblies must conform with the Constitution, including the Charter.

The new supremacy of constitutional law has implications for Canada's institutional framework, as it has the potential to affect historic relationships between legislatures and the judiciary, as well as between citizens and their governments. Examination of the Charter as a pillar of the constitutional order must take into account the powers and authority of the courts in protecting the rights and freedoms guaranteed in the Charter because the courts must determine inconsistencies between the Constitution of Canada and legislation. The Charter reinforces the courts' general responsibility for this judicial review by assuring court access to anyone whose rights or freedoms guaranteed by the Charter have been infringed or denied. The courts also assume a vital role in determining the forms of compensation or redress that any such person may receive: the Charter provides that courts may order "such remedy as [they consider] appropriate and just in the circumstances."[2]

Two other significant provisions provide further insight into the role that may be expected of courts under the Charter and illustrate the subtleties which pervade the new supremacy of constitutional law in Canada. Section 1, the "reasonable limitations" clause, and section 33, the "general override" provision, contain limitations on the rights and freedoms guaranteed by the Charter. These two provisions indicate the sensitive constitutional balance between courts and legislatures.

The general override provision enables Parliament or the legislature of a province to pass laws that are inconsistent with some, but not all, of the Charter's guarantees. It was included in the Charter at the insistence of provinces concerned about changes in the relative power of legislatures and courts. The major concern was that the entrenchment of rights would detract from the principle of legislative supremacy. The override provision retains some aspects of that supremacy.

Designated pieces of legislation may operate despite the existence of Charter protection for the fundamental freedoms, including freedom of conscience, of opinion and expression, of peaceful assembly and association (s. 2), legal rights (ss. 7–14), and equality rights (s. 15). However, to give effect to a legislative override of any of the Charter's guarantees, Parliament or the legislative assembly must expressly declare that an Act will operate notwithstanding a constitutional guarantee included in section 2 or sections 7 to 15. Such an express declaration will have effect for a period of up to five years, at which time it may be extended by the legislative body. This ensures that at least once every five years the legislating body will reconsider the specific use of the override. In such cases, parliamentary debate will provide the primary forum for scrutinizing the use of the general override power and for ensuring that its use is consistent with appropriate standards of responsible administration.

Commissioners are anxious that the Charter's general override provision should contribute to public awareness of legislation limiting the constitutional rights of citizens in Canada. In our view, overriding legislation should include a declaration of intent to legislate, notwithstanding a provision of the Charter, and should include not only reference to the specific rights being overridden, but also an explicit indication of the purpose of such legislative action. Such a statement of purpose would help to establish the scope of limitations and could also be referred to in discussions on whether to extend an override after the five-year period.

Shortly after Queen Elizabeth II proclaimed the Constitution Act in April 1982, Quebec's National Assembly passed legislation exempting Quebec laws passed prior to the Charter from sections 2 and 7 to 15 of the Charter. Quebec legislation that post-dates the Charter includes an express declaration of the non-applicability of these sections of the Charter. Although the National Assembly took these actions to reinforce the Quebec government's general repudiation of the Constitution Act, a legal challenge arising from the Quebec measure presents the Supreme Court of Canada with an opportunity to establish important rules about the use of the general override provision and the obligation of governments to adopt a specified form and content for invoking this clause.

In addition to its basic significance for parliamentary supremacy, the general override clause will have important consequences for the interaction of guarantees of rights and Canadian federalism. Since the national and provincial governments are able to enact the general override power in certain circumstances, wide variations among provincial governments' policies respecting fundamental, legal, and egalitarian rights in Canada are permitted. Variations in citizens' rights across the country are a possible consequence. The degree of variation which emerges will depend, in part, on the characterization of the right in jurisdictional terms. For example, if the courts decide that many of the fundamental freedoms, such as freedom of expression or legal rights, belong within federal jurisdiction, extensive variation is unlikely. In such instances a provincial override would obviously not apply, and courts could rule invalid provincial laws violating these rights, on the basis that the provincial government acted beyond the scope of its legislative authority under the Constitution Act. In areas within provincial jurisdiction, however, variation may be quite profound.

The use of the override by the national government would not result in rights variations among Canadians, but would of course take precedence over the specific right or rights with which the legislation is in conflict.

In Commissioners' view, the existence of the general override clause enables the courts to enforce more strictly the Charter guarantees of fundamental freedoms (s. 2), legal rights (ss. 7–14), and equality rights

(s. 15). Knowing that governments have recourse to a legislative override power if they believe the judicial tests are particularly inappropriate, courts should be able to establish very stringent tests for otherwise limiting fundamental, legal and egalitarian rights through the reasonable limitations provision of section 1 of the Charter.

In addition, the inclusion of the general override clause suggests to Commissioners that the drafters intended to provide few other opportunities for limiting the Charter's guarantees. This conclusion is supported by an examination of section 1, the second general authority for limiting the Charter's guarantees. Section 1 of the Charter has been called the "restrictive" clause, the "general limitations" clause or the "reasonable limits" clause. It applies to all the rights and freedoms guaranteed in the Charter. This provision makes explicit what in many constitutions is merely implicit: that no right is absolute. Circumstances may arise when some rights have to be balanced with other rights; there must be a balance, for example, between freedom of speech and protection of the reputation or privacy of individuals, and between the rights of individuals and the interests of the community. Nonetheless, conditions under which limitations on the rights guaranteed in the Charter can be imposed are stringent.

The section 1 provision makes clear that the rights and freedoms set out in the Charter are "subject only to such reasonable limits, prescribed by law, as can be demonstrably justified in a free and democratic society." It is for the courts to determine whether these conditions have been met in any particular circumstance. Early court judgements indicate that the onus of proof for meeting these conditions will fall on those who seek to limit rights and freedoms, rather than on those who claim that their rights and freedoms have been infringed or denied. Already the courts have indicated that they will not be satisfied by legislatures simply declaring that they deem an action to be reasonable and justified.

Changes to the wording of section 1 throughout the constitutional drafting process had the effect of making it more difficult to justify limitations on Charter rights. Initial drafts had provided that the Charter's guarantees were "subject only to such reasonable limits as are generally accepted in a free and democratic society with a parliamentary system of government." The accepted stronger wording that subsequently became the basis of the Constitution Act, 1982 required that limits be "prescribed by law" and be "demonstrably justified in a free and democratic society." These more stringent terms suggest standards of justification that will not be met through simple parliamentary consensus or executive decision.

Section 1 has the potential to affect profoundly the judicial process in Canada. In effect, this clause requires courts to determine whether legislative actions are justified and reasonable in a free and democratic society. Given the nature of the judicial process, courts can make such assessments only on a case-by-case basis. As noted above, however, the courts have already begun to establish their general approach. They appear to have adopted tests to ensure not only that the objective of proposed limitations is justified, but that the means of achieving it are also acceptable. In Commissioners' view, section 1 is meant to ensure that limits imposed on the rights and freedoms guaranteed in the Charter are not only reasonable, prescribed by law, and demonstrably justified, but also constrain rights as little as possible in order for them to achieve their objectives. These criteria restrict legislatures and emphasize once again that legislative enactments and government practices must be consistent with the guaranteed rights and freedoms set out in the Charter.

Commissioners believe that the Charter marks a significant change in Canadian constitutional law and entails major consequences for the tradition of parliamentary supremacy. The Charter has enshrined the fundamental rights and freedoms of citizens in their relations with governments. Henceforth, provisions of the Charter interpreted by the courts will constrain government activities. The extent to which the Charter will directly affect Canadian society will be determined by the scope of the Charter's applicability, an issue also addressed in the Constitution Act, 1982.

The "applications section" of the Charter indicates that it applies:

> *(a) to the Parliament and government of Canada in respect of all matters within the authority of Parliament including all matters relating to the Yukon Territory and Northwest Territories; and*
> *(b) to the legislature and government of each province in respect of all matters within the authority of the legislature of each province.*[3]

The meaning of "Parliament" is relatively straightforward. The term "government" is much less precise and could be interpreted in a number of different ways. For example, government could encompass only the legislation, regulations and administration of Parliament and the legislative assemblies; more likely, it could also extend to Crown corporations, regulatory agencies and the judiciary. It could also be interpreted to include agencies and organizations that receive their funds from governments. It could even incorporate the contractual relationships of governments. While it seems clear that the drafters did not intend the Charter to apply to all aspects of private activity, there is a sizeable "grey area" where it is difficult to determine whether particular actions are "governmental", especially today, when governments act through a wide range of instruments and mechanisms.

The existence of a range of other plausible possibilities reflects the complex and pervasive interdependence of state, society and the economy noted throughout this Report. To define the extent of the term "government" is likely to be one of the most complex exercises in Charter interpretation. There is probably no one "correct" interpretation, but already there is a sizable literature offering various definitions and approaches.

The Supreme Court of Canada has attempted to come to terms with the meaning and scope of "government" in a number of past decisions. These approaches may usefully inform its definition of the term in reference to the Charter. No one seriously questions that the activities of a delegate of Parliament or of a legislative assembly will be covered by the Charter. With respect to the Charter, lower courts have upheld the general rule governing delegated authority: subordinates cannot do what their principals cannot do.[4] Similarly, the Supreme Court of Canada recently held that the term "government" includes regulation-making activities of various boards and agencies, where these regulations are made subject to the approval of government.[5]

Other court decisions have distinguished between the public and private nature of an activity to determine whether that activity is rightfully considered a part of government.[6] By adopting such an approach, the court was able to conclude that a Crown corporation may be public in some aspects of its activities and private in others. This approach seems to Commissioners a flexible means of ensuring that the Charter has effect in the grey areas where public authority is exercised, as well as in the more visible legislative forums.

Commissioners believe that courts should take a flexible approach in determining whether an activity is governmental in nature, focusing in each case on the purpose of the specific actions in question. There are no firm rules to determine when private action becomes public action or vice versa. A "government-function test" would undoubtedly include within "government" such legislating bodies as municipal governments and school boards and such regulatory bodies as the Canadian Transport Commission and the Canadian Radio-television and Telecommunications Commission. It would not automatically cover the corporate and commercial activities of Crown corporations.

To determine when an actor is performing a public function is only part of the difficulty of defining the scope of government. There remains the matter of determining the amount of government involvement permissible in an activity before that activity becomes governmental – and thus subject to the Charter – rather than private. For example, if an organization of private interests receives funding from the government, should it be subject to the provisions of the Charter? Similarly, if an organization has a government contract to perform certain services, is that organization bound by the Charter, at least to the extent of its performance responsibilities under contract?

In Commissioners' opinion, infringement of rights may occur at the periphery of government involvement as easily and as often as in the more visible legislative process. A broad application would be a recognition that indirect governmental action may be as restrictive of individual rights as direct governmental action.[7]

Regardless of how courts interpret "government" in the context of section 32 of the Charter, Parliament and the legislative assemblies can use their authority as granting bodies and contractors to ensure that private organizations receiving public monies comply with the spirit of the Charter. Such compliance can be a component or condition of the funding or contract agreement. Using the approach known as "contract compliance", for example, a government can insist that firms doing business with it comply with specified hiring and personnel practices that conform to the spirit of the Charter. In such an instance, the firm would be complying with government regulations or policy and not with the Charter *per se*, and the government would have to establish appropriate enforcement mechanisms. The use of such compliance regulations could extend the spirit of the Charter and its guarantees to a wide range of activities.

The Charter and Civil Liberties

The Charter enshrines in the Canadian Constitution several categories of rights and freedoms which can be divided into two broad groups: the traditional civil liberties of democracies and the rights concerned with problems of cohesion in the Canadian political community.

The first group includes four classes of rights enunciated in the Charter:

- Fundamental freedoms (s. 2) of conscience, religion, thought, belief, opinion, expression, association, peaceable assembly and freedom of the press
- Democratic rights (ss. 3–5) to vote and run for office and the guarantee of regular elections
- Legal rights (ss. 7–14) including, among others, the right to life, liberty and security of the person; the right to be secure against unreasonable search and seizure; the right not to be arbitrarily detained or imprisoned; the rights to be told promptly of reasons for arrest, to retain counsel, and not to be denied reasonable bail without just cause; the right to trial by jury, except in specified instances; and protection from double jeopardy
- Equality rights (s. 15) prohibiting discrimination, including discrimination based on race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability.

In the traditional view, this group of rights is sometimes referred to as "negative freedoms": they protect and secure the freedom of individual citizens by limiting the power of government. There is, however, a major departure from this approach. The affirmative action provision accompanying equality rights permits governments to pursue programs to ameliorate the conditions of disadvantaged individuals or groups, even if these programs may violate the equality rights of others. We shall return to affirmative action below.

The "negative freedoms" approach was the dominant philosophy in Canadian thought on human rights before the 1970s. It gained particular prominence in the post-Second World War period and shaped the 1960 Bill of Rights. It was the main theme in most general and theoretical discussions of civil liberties. Attention focused above all on protecting the rights of citizens by seeking limitations on the use of discretionary power by the ever-expanding administrative state.

Since the 1920s, pockets of support for more stringent controls on government powers have developed across Canada. For example, the 1933 Regina Manifesto of the newly created Co-operative Commonwealth Federation (CCF) made a strong call for human rights protections against what it considered excessive police powers in specific sections of the Criminal Code and unjust procedures under the Immigration Act. The CCF called, also, for anti-discrimination legislation and affirmation of a Canadian commitment to the fundamental freedoms of speech, of association and of the press. In 1945, a CCF Member of Parliament introduced in the House of Commons the first motion proposing a constitutional bill of rights. It was the beginning of a long campaign to have a bill of rights included in the Constitution, with guarantees for minority rights, equality rights, civil and religious liberty, freedom of speech, and freedom of assembly. In 1947, the provincial CCF government in Saskatchewan introduced the first comprehensive human rights legislation in Canada.

Parallel to this activity, during the Depression and the period of the Second World War, various bar associations across Canada expressed concern about violations of basic civil liberties. They were concerned primarily with violations of the so-called "economic rights": the right to choose the place and type of one's employment; to buy and sell available goods in the open market; to fix, or bargain for, prices; to import and export; to enter into or expand business; to be free of price control; and to lease and to terminate leases.[1] In 1943, the Canadian Bar Association established a Civil Liberties Section which prepared annual reports on various problems relating to civil liberties during the 1940s and began to consider a proposal for a Bill of Rights as the decade closed.

Public concern over the abuse of citizens' rights by government broadened with two events in the 1940s: the wartime treatment of Japanese Canadians and the secret conduct of spy trials. Japanese Canadians and other Orientals had experienced discrimination in Canada before the war, but after hostilities erupted with Japan in 1941, the Government of Canada, using authority under the War Measures Act, obliged Japanese Canadians living along the Pacific coast to surrender their lands, homes and property, and forced them to move to internment camps away from the coastal area. Later the federal government relocated many to other parts of Canada. Relocation programs lagged, and in 1945 the federal government announced that those who did not want to relocate could be voluntarily "repatriated" to Japan once such action became possible. As it became apparent that the decision to repatriate was not always "voluntary", and that it would apply to naturalized and Canadian-born citizens of Japanese ancestry, public support for the Japanese Canadians and outrage over the repatriation scheme led the federal government to rescind the order in 1947. The wartime treatment of Japanese Canadians has become a deep scar on Canada's civil rights record.

Secret orders-in-council and spy trials associated with the Igor Gouzenko affair in 1945 and 1946 also contributed to popular concern for the better protection of civil liberties and legal rights and provoked sharp criticism of the government's conduct. Using powers granted under the National Emergency Transitional Powers Act, the Minister of Justice was empowered to detain "in such place and under such conditions as he may from time to time determine" anyone whom he suspected of being likely to communicate secret information to a foreign agent. A number of arrests were made. The government did not lay charges at the time of arrest, held many of those arrested incommunicado, and did not advise them of their legal rights. Subsequently, a Royal Commission investigation, conducted *in camera* by two justices of the Supreme Court of Canada, led to charges against many of those arrested. When the public learned of the extraordinary nature of the procedures followed, the government was severely criticized. The Civil Liberties Section of the Canadian Bar Association argued that if Canadians tolerated such violations of basic civil liberties in peacetime, then "we [were]

. . . in grave danger of having substituted for the rule of law . . . the alien principles of the Totalitarian State."[2]

These two events contributed to growing concern about the protection of civil liberties in Canada, which culminated in the 1960 Bill of Rights. Although the War Measures Act authorized both events, the 1960 Bill did not curb the powers available to the Attorney General under that Act, except by requiring that Parliament debate any proclamation of the Act. The Charter of Rights and Freedoms makes no mention of the War Measures Act, though the courts are able to determine whether or not, in curtailing a guaranteed right or freedom, a proclamation of the Act meets the reasonable limitation test set out in section 1.

Support for more protection against the abuse of governmental authority grew during the 1950s also, as a consequence of events in Quebec. The courts determined that various pieces of Quebec legislation, directed primarily against activities of the Jehovah's Witnesses and the Communist Party of Canada interfered with such basic freedoms as freedom of religion, of assembly, and of speech. Moreover, in the much publicized case of *Roncarelli* v. *Duplessis*,[3] the Supreme Court of Canada determined that Premier Maurice Duplessis, acting in his capacity as Attorney General, had exceeded the authority of his office in violation of the fundamental constitutional principle of the rule of law.

Increasing awareness of the need to protect fundamental human rights was not unique to Canada during the post-Second World War period. The United Nations, formed at the end of the war, took steps to outline a model of human rights guarantees in the 1948 Universal Declaration of Human Rights and in a number of later conventions. Some of the momentum for a Canadian bill of rights and some of the ideas about what it should contain, were the product of a post-1945, world-wide, human rights movement and of Canada's desire to be an international leader in this field, as in other areas of international affairs. In 1950, the Special Committee of the Senate on Human Rights and Fundamental Freedoms (the Roebuck Committee) recommended that Canada adopt a bill of rights modelled closely on the United Nations Declaration.

After the Second World War, Canadians were redefining the basic symbols of the Canadian state in light of our continuing evolution from colony to nation. During debate on the Citizenship Act in 1946, for example, one MP noted that even if a bill of rights did no more than make explicit the traditions of liberty in parliamentary systems, it would be a symbol for all Canadians, and especially for new Canadians, of the norms and values of our country. An increasingly heterogeneous and ethnically diverse population no longer appeared able to rely on unwritten protections of civil liberties: a written code was needed.

Thus, when Parliament agreed to the Bill of Rights in 1960, the legislation reflected an idea whose time, in Canada, had come. The "negative freedoms" approach to civil liberties shaped the Bill, which guaranteed to citizens freedom from various forms of state action. The first two sections of this bill contained most of the guarantees of rights.

The first section established the continuity of its content with the existing practices and traditions in Canada:

> *It is hereby recognized and declared that in Canada there have existed and shall continue to exist . . . the following human rights and fundamental freedoms.*[4]

This section included equality guarantees prohibiting discrimination based on race, national origin, colour, religion or sex. The guarantees, limited to "equality before the law and the protection of the law",[5] were entirely consistent with the "negative freedoms" approach of this Bill, but they would seem inadequate to a later generation concerned as much with substantive equality as with procedural guarantees. Nonetheless, the Bill reflected the major equality concerns of its own day.

The second section of the Bill outlined guarantees of legal rights. An express declaration of Parliament could override these rights, but in the absence of such express declarations, the rights and freedoms outlined in the section would prevail. The protection of civil liberties under the Bill of Rights disappointed civil libertarians. With the major exception of the Drybones decision[6] in 1970, the Supreme Court of Canada was unwilling to elevate the Bill of Rights to a special constitutional status. As Supreme Court Justice Bora Laskin said in 1972:

> *. . . compelling reasons ought to be advanced to justify the Court . . . [employing] a statutory (as contrasted with a constitutional) jurisdiction to deny operative effect to a substantive measure duly enacted by a Parliament constitutionally competent to do so, and exercising its powers in accordance with the tenets of responsible government, which underlie the discharge of legislative authority under the British North America Act, 1867.*[7]

Even as the 1960 bill was being legislated, critics noted a number of weaknesses. The bill would apply only to matters of federal jurisdiction; even in the federal sphere, it had the status only of simple legislation and was not in any sense an entrenched or an overriding document. It explicitly permitted Parliament to legislate, notwithstanding its provisions. Some observers also foresaw major developments in human rights that would render the Bill of Rights inadequate almost immediately. In particular, some Canadians had begun to think that negative freedoms insufficiently guaranteed the rights of citizens. To limit the abuse of state power was necessary and desirable in a Bill of Rights; but it was necessary, also, to provide for means by which government could actively intervene on behalf of the rights of citizens and secure conditions which would allow all individuals to enjoy their rights. These views became increasingly popular, especially among members and activists in the civil rights movements of the 1960s.

The American civil rights movements of those years focused first on the rights of American Blacks, but as the movement developed, its message of equality was adapted to the interests of many other groups including women, the handicapped, young and old people, homosexuals, lesbians and others. Supporters of most of these movements wanted more than negative rights and freedoms. They demanded that government actively intervene to dismantle the obstacles to equality.

The Charter of Rights and Freedoms has moved Canada in this activist direction. While it continues to stress the traditional negative freedoms, it encourages governments to pursue greater equality for Canadians. For example, the guarantees of equality rights in the Charter enable governments to combat the underlying causes of discrimination more directly. The drafters of the Charter recognized that social and economic conditions can prevent enjoyment of equality rights; they believed that the freedom and rights of citizens require positive interventions of government, as well as the traditional negative freedoms.

The equality rights in the Charter (s. 15) expand on earlier equality provisions in two obvious ways. The provisions reflect a broad concern with the social and economic origins of inequality. The bases of discrimination specifically prohibited in the Charter – race, national or ethnic origin, colour, religion, sex, age or mental or physical disability – are not exhaustive; there is also a general guarantee of individual equality. Moreover, the guarantees of the Charter add "equality under the law" and "equal benefit of the law" to the equality categories previously found in the Bill of Rights. The equality rights guarantees are perhaps the most dramatic example of changed thinking on fundamental human rights since 1960, but similar patterns of change are also found in the other civil liberties of the Charter. This is true, for example, of the legal rights provisions, contained in sections 7 to 14.

Section 7 of the Charter, which begins with a general statement of legal rights, and which acts as an umbrella provision for the detailed sections that follow it, states that:

> *Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice.*

Like other provisions of the Charter, this section deals, in constitutional terms, with relations between citizen and state. By setting out broad rights to "life, liberty and security of the person", the Charter underlines a fundamental value of Canadian society. The addition of "the right not to be deprived thereof except in accordance with the principles of fundamental justice" addresses vital issues of particular significance to criminal procedure. The phrase "principles of fundamental justice", which appears both in section 2 (*e*) of the Canadian Bill of Rights, and in the Charter, is designed to safeguard the right to a fair hearing, to notice of proposed charges, to present one's case before an impartial tribunal, and to cross examination. The drafters believed that a free and open court system based on adversarial testing of propositions and evidence designed to arrive at the truth is central to a free and democratic society. Such a system is an attempt to restrict possibilities for arbitrary action by the state.

In Canada, criminal law is the legislative responsibility of the federal government; criminal law is largely found in the federally-enacted Criminal Code of Canada. The provinces are responsible generally for the administration of justice, including criminal justice, within their own borders. The courts supervise the criminal-justice system to ensure its proper functioning, and impose rules for this purpose. The best known of these, the Judges' Rules, contain conditions laid down by the British judiciary for procedures to be followed by police forces when taking statements from suspects.

The Canadian Bill of Rights continued the process of codifying both judge-made or "common" law and the principles implicit in the Criminal Code. Because of federal responsibility in this area, the fact that the Bill of Rights did not extend to provincial jurisdictions was not as important as it was for other guarantees of rights and freedoms. Thus the Charter's provisions concerning legal rights come from a long history of judicial interpretation and legislative enactment. The complex judicial evolution of the legal rights provisions in the Bill of Rights suggested the need for detailed provisions in the Charter.

The specific provisions contained in sections 8 to 14 of the Charter are designed to parallel the operation of the criminal process. Section 8 ("search or seizure") and section 9 ("detention or imprisonment") apply to citizens under investigation; section 10 relates to "arrest or detention"; and section 11 covers those "charged with an offence". Section 12 is a sentencing provision. Finally, two provisions applicable to witnesses round out the legal rights: section 13 provides that a witness, in giving evidence, cannot be incriminated in a subsequent proceeding, and section 14 provides interpretation facilities where a party or witness does not understand the language of the proceeding.

While the bulk of the legal rights provisions apply to the criminal-justice system, they are also important in other areas where citizens are subject to official control or regulation. For instance, while the definition of crime is a federal responsibility, provinces and municipalities impose sanctions in fields from securities law, where a penalty provision may include imprisonment, to parking offenses, where the $3 penalty is not yet extinct. The Charter now subjects proceedings related to these offences to the same legal rights that the Bill of Rights previously guaranteed for offences under the Criminal Code. Similarly, protection from "cruel and unusual treatment or punishment" is extended to the actions of a wide number of provincial institutions. Thus, for example, provincial mental health legislation, hospital acts, or procedures established for patients confined against their will may also be scrutinized by the courts in light of the Charter.

These legal rights provisions are designed as much to influence the administration of justice as to strike down or limit legislative initiatives. The administration of justice is the responsibility of the provincial Crown prosecutors as well as of the federal prosecutors, but legislative responsibility in criminal matters resides squarely with the federal government. To the extent that provincial behaviour in administering the law is governed by federal legislation which the provinces cannot amend, a province cannot alter its behaviour without the legislative support of the federal government. Thus, although the Charter's general override clause applies to the legal rights provisions, opportunities for provincial variations in criminal procedures are limited.

In the area of police powers, good administration and law enforcement necessitated a statement of direction to the criminal-justice community. Section 24(2) states:

> *Where, in proceedings under subsection (1), a court concludes that evidence was obtained in a manner that infringed or denied any rights or freedoms guaranteed by this Charter, the evidence shall be excluded if it is established that, having regard to all the circumstances, the admission of it in the proceedings would bring the administration of justice into disrepute.*

In the course of an investigation, the police or the Crown may use inappropriate techniques and thereby obtain evidence that would not otherwise have been obtained. In what circumstances should evidence so obtained be admissible against an accused person? What is the appropriate sanction for activity that the court finds to be inappropriate?

The American "forbidden fruit" doctrine ruled that such evidence and all that flows from it are inadmissible in the courts. Thus juries do not hear a statement or confession that would otherwise be admissible or see physical evidence collected as a result of the statement. Suppose the police in Canada use a wiretap without appropriate authorization under the Criminal Code. In the conversations they record, they hear about the movement of drugs and thus effect an arrest. They have both oral evidence of a conspiracy and physical evidence at the time of the arrest. Fundamental policy choices arise in this situation. Should this evidence be admissible? If it is not, the suspects would be released; if it is, the courts appear to condone unlawful activity by agents of the state. Should a suspected felon be freed to compensate for the errors or wrongdoing of police personnel? The Charter gives judges considerable scope to control unacceptable police behaviour.

Legal rights will evolve within the general framework of the Charter, and it will be recalled that section 1 provides that both laws and actions that are demonstrably justified in some circumstances can be found valid despite apparent inconsistency with the Charter. However, the legal rights provisions themselves contain qualifications similar to those found in section 1. Phrases such as "principles of fundamental justice", "unreasonable search or seizure", "arbitrarily detained or imprisoned" or even "informed promptly" give the courts the responsibility to flesh out the evolving meaning of these standards.

The evidence rule outlined in section 24(2) and the internal qualifications in the legal rights guarantees require courts to consider the actions of the prosecution to ensure that in specific circumstances, an appropriate balance has been reached. These qualifications do not relate only to unreasonable laws, but to unreasonable activity. That is their principal thrust.

The Charter, National Cohesion and the Canadian Community

The Charter contains some guarantees of rights best understood as efforts to promote social cohesion and national unity. The provisions in this group of rights are closely associated with the social role of the modern state as Commissioners have previously described it: that is, the task of representing and reconciling cultural, linguistic, territorial and other facets of our diversity. This broad group of rights in the Charter includes language rights, minority-language/education rights, mobility rights and the guarantee that the Charter is to be interpreted in a manner consistent with the preservation and enhancement of our multicultural heritage. These guarantees do not focus exclusively on individual rights. Though this remains a primary concern, these rights have profound implications for Canadian federalism and for relations between the national and provincial communities. This is particularly true of the minority-language/education and mobility rights.

Discussions during 1980–82 on these "national community" guarantees often seemed more a political tug-of-war between two levels of government than a discussion of the rights of citizens. The debate reflected that governments were quite naturally concerned with the consequences of the Charter's provisions for their jurisdictional authority, that the Charter was the centre-piece of the federal government's promise to the people of Quebec of "renewed federalism", following the Quebec referendum, and that inclusion of mobility rights was central to federal proposals for securing the economic union.

In the process of negotiation, the proposals were significantly altered. The provisions in the Charter reflect compromises and concessions. Federal-provincial relations and the issues of unity in the federation preoccupied Canadian politicians in the early 1980s and affected the Charter. Provisions of the Charter that relate to communities and national cohesion will illustrate the point. Commissioners will consider first the provisions respecting official languages and cultural groups and then turn to mobility rights.

Official Languages and Minority-Language Education

The Charter's guarantees for language rights and minority-language education are found in sections 16 to 23. In effect, sections 16 to 21 give constitutional status to parts of Canada's official languages legislation and to that of New Brunswick. Residents of Canada have the right to communicate in English or French with the federal government, to receive services in either official language where there is significant demand, or where it is reasonable for such services to be provided, and to use English or French in Parliament and in all courts of law under federal jurisdiction. Governments may expand, but not diminish, the rights guaranteed in the Charter.

Section 22 affirms that the language guarantees in the Charter do not abrogate or derogate "from any legal or customary right or privilege acquired or enjoyed before or after the coming into force of the Charter with respect to any language that is not English or French." However, the most significant new language right created by the Charter appears in section 23. The Ontario Court of Appeal has suggested in a recent judgement that section 23 "creates a code which establishes minority language education rights for the nation."[1] Section 23 confers two rights:

- Parents who qualify under section 23 have the right to have their children receive publicly funded primary- and secondary-school instruction in the minority language of English or French wherever the number of children of such citizens warrants.
- Parents who qualify under section 23 have the right to have their children receive that instruction in English or French minority-language educational facilities provided out of public funds, again, where the numbers of children warrant.

Court judgements to date suggest that the number of parents required to make these provisions operational will vary from area to area within Canada.

There are three main criteria by which citizens can qualify for minority-language/education rights. Under section 23 (1)(*b*) the so-called "Canada clause", the children of Canadian parents whose primary-school instruction in Canada was in English or French have the right to receive their primary and secondary school instruction in the corresponding language if they live in a province where speakers of English or French form the linguistic minority. The brothers and sisters of children educated in English or French in Canada also have the right to primary and secondary instruction in the corresponding language. Canadian citizens also qualify for these rights for their children if their own mother tongue, the first language learned and still understood, is English or French. This last provision will not take effect in Quebec, however, until the National Assembly or the Government of Quebec authorizes it. This special provision for Quebec was part of an effort to accommodate the concerns of the provincial government on the future of French in Quebec, in return for the province's support for the package of reforms as a whole.

The rights expressed in section 23 pertain to individual citizens who live in a community with a significant number of others who have as their mother tongue the same minority official language. The courts must establish criteria for determining "where numbers warrant". Thus the continuing availability of this right will probably depend on the existence of appropriate concentrations of those speaking a minority official language. The number of children in any particular area may, in the future, fall below that needed to meet the "numbers" requirement. Courts may then conclude that public authorities in such areas no longer need to provide minority-language education and people who have become accustomed to these facilities may find them no longer available.

The section on minority-language education in the Charter confers positive rights. It requires governments to provide publicly funded facilities and/or instruction, where circumstances warrant, rather than merely permitting them to take action. Significant efforts to give expression to these rights in the federal arena date from the publication in 1967 of Book I of the Report of the Royal Commission on Bilingualism and Biculturalism. The Commission recommended a number of steps, constitutional, legislative and policy-related, to enable the English- and French-language communities to co-exist and flourish in Canada.

Federal Official Language Legislation and Policies

Almost immediately after the tabling of the Report of the Royal Commission on Bilingualism and Biculturalism, the federal government adopted many of its recommendations. In 1969, Parliament passed the Official Languages Act, the first of a recent series of federal laws and programs to foster better relations between Canada's two major linguistic groups and promote linguistic equality in Canada. The Act improved on the British North America Act of 1867 by declaring English and French "offical languages", and by extending language rights to the activities of the Government of Canada generally and not just to those of Parliament. Henceforth the public had a right to communicate with, and to receive services from, federal departments, agencies, courts and Crown corporations in either official language.

To oversee implementation of the Official Languages Act, the government, in 1970, established the office of the Commissioner of Official Languages. The office has construed federal language policies broadly:

> *The whole purpose of the federal language effort is to resist the blandishments of a Canada split along language lines. The fundamental objective is to construct a society in which the minorities can expect to live much of their lives in their own language.*[2]

The federal government directs its language policies both at the federal public service and at Canadian society as a whole. In the federal public service, it has sought equitable participation of the two major linguistic groups, availability of government services in the two official languages, and establishment of both French and English as languages of work in the federal public service.

The proportion of francophones in the federal public service increased from 13 per cent in 1974 to 27.5 per cent in 1983, a figure roughly equivalent to the percentage of francophones in Canadian society. Areas of the country with a small francophone population, however, have very few bilingual public servants. In the four Western provinces, there were 50 000 federal public servants in 1983. Fewer than 800 of these were qualified bilinguals in designated bilingual positions serving approximately 185 000 francophones in the region.[3] The provision of federal services in French in those provinces suffers. Francophones are also underrepresented at different ranks and in different kinds of activities in the public service.

Failure to achieve an appropriate nation-wide distribution of bilingual public servants means that Canada remains a country divided along linguistic lines. Research suggests that the federal public service reflects a country divided into three groups: a Quebec group primarily French, but offering bilingual services; a narrow "bilingual belt" where services are provided in both official languages from Moncton, New Brunswick, to Sault Ste Marie, Ontario, and anglophone Canada, where services are largely available in English only. The figures parallel the distribution of francophones in Canada: 80 per cent live in Quebec, and most of the remainder live in the Moncton-Sault Ste Marie bilingual belt.

Federal policies on language of work aim to allow official-language minorities a more natural, less restricted choice of working language in the federal administration. In practice, the goal remains elusive. Outside Quebec and the National Capital Region, French is rarely a language of work on a day-to-day basis. Setting up an infrastructure of "bilingual documentation" and "bilingual occupants of bilingual positions" has not made people feel free to work in whichever language comes most naturally. Data for 1981 released by the Treasury Board show that in internal communications in bilingual regions, anglophones use French 18 per cent of the time, while francophones use English 47 per cent of the time. In spite of the relatively low use of French by francophones, Treasury Board data show that francophones are relatively more satisfied than anglophones (72 per cent as compared to 49 per cent) with existing proportions of language use among public servants in bilingual positions. These data prompted the Commissioner of Official Languages to wonder whether "the question might reasonably arise whether we should leave well enough alone. In other words, is it not paternalistic to suggest that Francophones should want to use more French, despite apparent affirmations to the contrary?"[4]

The bilingualism program in the public service has had considerable success. In 15 years the participation rate of francophones has risen compared to their proportion of Canada's population, the number of bilingual anglophones has increased dramatically, and availability of bilingual public services has increased in some areas of our country. It is equally clear, however, that our bilingual goals for the federal public service remain elusive outside the limited bilingual-belt area; the language-of-work policy has had even more limited success.

The federal government also directs its language policies at the broader Canadian community. The objectives of these programs are to promote bilingualism among Canadians, to enhance and preserve minority official languages, and to foster an appreciation among all Canadians of the equal status of our two official languages. It is not Commissioners' purpose here to review these programs, but a brief comment on the program that the former Commissioner of Official Languages has called "a Canadian success story of the first order"[5] illustrates the rapid progress of bilingualism among anglophones.

According to one American authority on language acquisition:

> *Canadian immersion is not simply another successful language teaching programme – it may be the most successful programme ever recorded in the professional language-teaching literature.*[6]

Realization by anglophone Canadians of the economic and other benefits of bilingualism and widespread availability of the programs account for the popularity of French-immersion education in our country. Registration in these programs has grown phenomenally, and the number of schools offering

French immersion has increased by leaps and bounds. From 1977–78 to 1984–85, the number of schools offering French immersion programs increased by over 300 percent from 237 to 988. Total enrolment for 1984–85 is approaching 150 000.[7] Enrolment is still concentrated in the early grades, though there is a recent trend toward high-school immersion. Each year the size of the entering group grows.

Over the past decade, the federal government has encouraged several provinces to become officially bilingual. It expressed the hope that other provinces, particularly Ontario, would follow the example of New Brunswick, which declared a provincial Official Languages Act in 1969. Despite provincial support for immersion programs and minority-language education, as well as initiatives by provinces such as Ontario to increase bilingualism in the provision of public services and enhance French in other aspects of daily life, no province other than New Brunswick has so far passed, on its own initiative, legislation making French and English the official languages of the province.

While official bilingualism requires a supporting legal framework, bilingualism is not a matter simply of language laws. Recent public opposition to bilingualism in Manitoba and New Brunswick is a reminder that bilingualism policy in Canada can be set back by negative public reactions. It is therefore encouraging to note the public pressures for, and the positive responses of parents and children to, government-provided immersion facilities that will help to overcome language barriers. Yet much remains to be done. There must be further sustained effort to secure Canada's two official languages throughout the public service. Commissioners believe that it is important to consolidate the progress of the past and to continue to build on existing foundations. Our history, as well as more recent events, indicates that continued government leadership is essential.

Legislative and policy initiatives tell only part of the story of attempts to promote bilingualism and official language policy across Canada. The new constitutional rights to minority-language education and constitutional recognition of the two official languages, are central components of federal efforts to preserve and enhance official languages across our country.

Federal Constitutional Initiatives respecting Language since 1968

Since the Royal Commission on Bilingualism and Biculturalism recommended changes to the British North America Act, the federal government has advocated constitutional recognition of official languages and minority-language/education rights. That Commission recommended that section 93 of the British North America Act be amended to provide that:

> *Every province shall establish and maintain elementary and secondary schools in which English is the sole or main language of instruction, and elementary and secondary schools in which French is the sole or main language of instruction, in bilingual districts and other appropriate areas under conditions to be determined by provincial law; but nothing in this section shall be deemed to*

> *prohibit schools in which English and French have equal importance as languages of instruction, or schools in which instruction may be given in some other language.*[8]

Elsewhere in its Report, the Commission argued that parents should be free to choose the official language in which their children would be educated, and that this instruction be publicly funded where numbers warrant.

In a 1968 white paper, *A Canadian Charter of Human Rights*,[9] Justice Minister Pierre Trudeau proposed that the recommendations of the Commission be entrenched in a constitutional bill. A year later, as Prime Minister, he elaborated. Language rights, he said, were individual rights that should be guaranteed to all citizens no matter where they live in Canada. Language rights, like other human rights, were essential protections for individual citizens, both in their relations with governments and in their relations with one another.[10] Following publication of the Report of the Royal Commission on Bilingualism and Biculturalism, the Government of Canada proposed to entrench language rights and minority-language/education rights. Its position remained essentially unaltered throughout the 1970s.

There was a gradual movement away from the philosophy of universal free parental choice, caused by events in Quebec in the 1970s and the efforts of successive governments in that province to stem the declining use and status of French among Québécois. Acting on the recommendations of the provincial Commission of Inquiry on the Position of the French Language and on Language Rights in Quebec (Gendron Commission, 1972), in 1974 the provincial government of Robert Bourassa declared French the sole official language of the province. This declaration was not welcomed by the federal government, which was encouraging the provinces to move toward bilingualism. Moreover, in an attempt to steer immigrant children into French schools, the Quebec legislation restricted access to English-language education to those with demonstrated fluency in English.

With the election of the Parti québécois and the introduction of the French Language Charter (Bill 101) in 1977, Quebec's policy diverged even more decidedly from that of the federal government. In addition to declaring French the sole official language, the Quebec Charter declared that French would be the only language of official record in the National Assembly, that judgements rendered by Quebec courts would be in French, and that the French text of legislation would be the sole authentic version. Other parts of Quebec's French Language Charter dealt with matters affecting the use of French at work and in daily life.

Quebec's French Language Charter also stipulated that with certain limited and temporary exceptions, only children with at least one parent educated in English in Quebec would be admitted to English-language public schools, unless a reciprocal agreement was established with other provinces to guarantee access to French schools for students whose mother-tongue was French. In 1979, in St. Andrews, Nova Scotia, Canadian provincial premiers, at their annual meeting, agreed among themselves to establish such a reciprocity (the St. Andrews Accord). However, the "Canada clause" provision in the Charter of Rights superseded this Accord, establishing access to minority-language instruction for the children of citizens qualifying under section 23 of the Canadian Charter.

These developments in Quebec during the 1970s, from the Gendron Commission Report to the Parti québécois's language legislation, had inescapable consequences for the federal government's language policy. Quebec's language legislation reinforced the federal government's resolve to protect French-language communities outside Quebec. The demands of Quebec's anglophone minority for the protection and security of its language demonstrated that English- as well as French-language minorities in Canada were seeking guarantees. It was clear, however, that the Quebec government would not accept universal free parental choice, which it believed, worked disproportionate hardships on the future of the French language in that province.

The provisions for minority-language/education rights in the 1982 Charter represented a compromise for the Government of Canada. That government had moved away from universal free parental choice, which was replaced by the "Canada clause"; in addition, the clause affecting new Canadians was not to be enforced in Quebec without that province's consent. Quebec's government would not accept the proposal: it was convinced that education, including language issues, remained, and should remain, under provincial jurisdiction and not be subject to external criteria. It has still not assented to the Constitution Act, 1982. Nonetheless, these provisions of the Canadian Charter are now the basic law of the land, and have as much effect in Quebec as elsewhere in Canada. Recent court proceedings have found parts of Quebec's French Language Charter inconsistent with the Charter of Rights and have ruled that in cases of conflict the Charter of Rights will prevail.[11]

Multiculturalism

Section 27 of the Charter states that the entire document is to be "interpreted in a manner consistent with the preservation and enhancement of the multicultural heritage of Canadians." This section will probably moderate and control laws that are offensive to the principles of a multi-ethnic society and cultural tolerance. By specifying multiculturalism as a distinctive aspect of the heritage of Canadians, the Charter recognizes the contribution and needs of the many cultural communities of Canada.

As a policy objective, multiculturalism is a new goal in Canada. The settling of the Prairies by European immigrants in the early twentieth century, the use of Chinese labourers before that to build the Canadian Pacific Railroad, and the even earlier migration of American Blacks to Nova Scotia are all part of the popular mythology of Canada as a culturally diverse "mosaic". Yet, at the end of the Second World War, Canadian national institutions only weakly reflected Canadian dualism, and there was little recognition of ethnic diversity. In the post-war period, the climate of opinion encouraged changes in our collective self-definition as a national community. Extensive immigration after the Second World War may have made the transformation inevitable. Changes within Canadian society have brought with them pressures to change the symbols of government and society to reflect the multi-ethnic composition of our national community.

The Royal Commission on Bilingualism and Biculturalism inspired contemporary federal policies of multiculturalism, just as it did the current approach to language policies. That Commission had not intended to devote much attention to the "other ethnic" aspects of its mandate, but after receiving strong representations from a number of ethnic groups, it devoted an entire book of its six-volume report to a review of the "third force" in Canada.

The federal government's concern with bilingualism helps to explain the timing of the policy of multiculturalism. Indeed, multiculturalism, introduced on the heels of the 1969 Official Languages Act, was the federal government's attempt to defuse some of Western Canada's criticism of the bilingualism policies. Nevertheless, to interpret multiculturalism only as a means to secure broader support for bilingualism, as some Canadians have done, is to miss other important matters. In fact, the policy of multiculturalism corresponded to several interrelated developments. The changing character of Canadian society after the Second World War brought a partial informal redefinition of the nature of the Canadian community. Within that community, a reallocation of status among linguistic and ethno-cultural groups was under way.

The federal government intended its multiculturalism policy to form another element in that reshaping of society:

> *A policy of multiculturalism within a bilingual framework commends itself to the government as the most suitable means of assuring the cultural freedom of Canadians. Such a policy should help to break down discriminatory attitudes and cultural jealousies. National unity if it is to mean anything in the deeply personal sense, must be founded on confidence in one's own individual identity; out of this can grow respect for that of others and a willingness to share ideas, attitudes and assumptions. A vigorous policy of multiculturalism will help create this initial confidence. It can form the base of a society which is based on fair play for all.*[12]

The Royal Commission on Bilingualism and Biculturalism expressed the premise of the federal policy: "Man is a thinking and sensitive being; severing him from his roots could destroy an aspect of his personality and deprive society of some of the values he can bring to it."[13]

Within a few years of introduction of the new policy, however, it became clear that a gap had developed between stated objectives and results. Some critics saw public support to third-force cultural groups as no more than assistance to ethnic folklore, and they called multiculturalism a "song and dance" routine.[14]

To other critics, the policy appears to maintain cultural distinctiveness among Canadians who are, in fact, living together in one national community. Many members of ethnic groups in Canada fear being "locked in" by ethnic boundaries. As one multicultural group told this Commission, "Ethnic Canadians . . . came here to be Canadians." (Council of National Ethnocultural Organizations of Canada, Brief, October 31, 1983, p. 3.) Another group, however, told us:

> *As long as we have a society where the most appreciated values are those of the dominant group, whether it is the Anglo-Saxon group or the Anglo-Celtic group, to the detriment of values and traditions that other groups can offer, then these minority groups will always suffer discrimination even though it may not be legislated discrimination or overt discrimination.*
>
> (Thunder Bay Multicultural Association, Transcript, Thunder Bay, October 17, 1983 [vol. 26], p. 5191.)

Commissioners believe that multicultural policy should preserve ethnic diversity without isolating the very groups this policy seeks to assist. It should permit all Canadians to preserve and enhance the culture and traditions of their heritage, but it should also be consistent with Canadian aspirations for greater individual equality.

To adjust to a multicultural society requires more than mere recognition and accommodation of diversity at the symbolic level. When multiculturalism involves racial diversity – as has been increasingly true of Canada – a pressing need can exist to confront and combat racism. For visible minorities, racism can be a source of day-to-day anguish. Canadians do not think of themselves as racist, yet considerable evidence suggests that ethnic minorities, and particularly some "visible" minorities, are victims of systemic discrimination in Canada. A number of recent studies show that some visible minorities experience severely limited economic and social opportunities, and that the underlying cause is lingering racism.[15]

It is unlikely that transformation of the symbolic order, affirmative action programs, and even the Charter's prohibition of racial discrimination will root out systemic discrimination. *Equality Now*, the report of the Special Committee on Visible Minorities in Canadian Society, contains 80 recommendations to combat racial discrimination. These include proposals to improve language training for immigrants, introduce voluntary affirmative action in hiring and promotion policies, amend Criminal Code provisions respecting hate propaganda, extend support for multicultural arts, and promote respect for the observance of various national days and holy days of different cultures. We Commissioners have not, in our research, addressed the issue of racial discrimination in the same depth as has the Special Committee. We can observe, nonetheless, that racial discrimination in Canada results in an unjustified and indefensible denial of the rights of some individual Canadians and a tragic waste of human resources. Efforts must continue to increase individual equality throughout the Canadian community.

Mobility Rights

Commissioners wish also to consider mobility rights as they relate to Charter provisions concerning national cohesion. The Charter contains the first constitutional expression of mobility rights for Canadians.

Section 6 of the Charter guarantees the right to every citizen of Canada to enter, remain in and leave Canada. This right is in accordance with the provisions of the United Nations International Covenant on Civil and Political Rights, ratified by Canada in 1976. The section guarantees, also, the right of citizens and permanent residents of Canada to live and seek employment anywhere in the country. The rationale for mobility rights within Canada is based on two assumptions: that barriers to personal mobility inhibit operation of the Canadian economic union, and that common citizenship implies freedom of movement within the country, unrestricted by provincially or federally created barriers.

Subsection 3 of section 6 restricts mobility rights in two ways. It permits limitations imposed by laws or practices of general application in a province (such as ordinary rules of employment concerning health, qualifications and union membership), where such laws or practices do not discriminate primarily on the basis of past or present province of residence. In addition, it permits provinces to impose reasonable residency requirements as a condition of eligibility for publicly provided social services. Subsection 4 enables provinces to pursue programs intended to ameliorate the conditions of socially and economically disadvantaged individuals when the provincial employment rate is below the national rate.

Quite apart from its potential to limit the mobility rights of Canadians, subsection 4 employs the terminology of "rate of employment", for which data are unavailable. The "rate of employment" is not the converse of the unemployment rate with which Canadians are familiar, the statistics of which are published monthly by Statistics Canada. One cannot infer that the rate of employment in a province is 90 per cent on the basis of knowledge that the provincial unemployment rate is 10 per cent.

Statistics Canada does publish statistics on the employment/population ratio which represents the number of persons employed, expressed as percentage of the population 15 years of age and over. However, officials of Statistics Canada and of several provincial Departments of Labour are not confident that these statistics would be accepted by the courts, for constitutional purposes, as appropriate indicators of the "rate of employment". So far the courts have not had occasion to pronounce on the issue. Thus, three years after the Charter came into affect, Canadians lack common understanding of the data base required to provide operational meaning to a key clause in the Charter which affects citizens' rights.

It is possible that when the "rate of employment" is defined by the courts, particular provinces with above-average rates of unemployment which represent the politically visible figure that evokes public reaction, may also have above average rates of employment and thus will be precluded from using subsection 4. It is also plausible that when a case finally reaches the Supreme Court, different governments will prefer different definitions and will employ competing statistical analyses to support their positions. The general assumption that all legislation is an experiment with the future applies with particular cogency to subsection 6(4) of the Charter.

This subsection, when judically interpreted, could affect the mobility of significant numbers of Canadians. The actual number of provinces entitled to implement measures intended to ameliorate the conditions of socially or economically disadvantaged individuals in the province will depend on the distribution among the larger and smaller provinces of rates of employment.

In the light of this potential problem, it is well to remember that the provinces supported the right of personal mobility in the constitutional negotiations that preceded the adoption of the Charter. They sought amendments to the federal government's proposal on mobility rights, not in order to undermine the general purpose of the clause, but rather to ensure that provincial governments did not lose the authority to manage their societies effectively. As Allan Blakeney, then Premier of Saskatchewan, explained:

> *While remaining committed to the maintenance and improvement of the Canadian Economic Union, provincial governments must also accept their responsibility for providing economic opportunity to Canadians residing within their province.*[16]

A number of conditions limit the ability of provincial governments to override the mobility clause. Section 1 of the Charter, the "reasonable limitations" clause applies to provincial schemes for preferential employment. It stipulates that all restrictions on the rights and freedoms guaranteed by the Charter must be reasonable and demonstrably justified in a free and democratic society. Provincial laws, programs or activities must be directed at those who are "socially or economicaly disadvantaged." In provinces with below-average employment rates, programs may give certain preferences to residents meeting specific qualifications, but they must not impose blanket prohibitions of mobility. Perhaps most significant, from the perspective of the Canadian economic union, the provisions on mobility rights are likely to be most effective in the provinces where they are most needed: those where there is a greater chance of obtaining employment.

Commissioners believe that the courts will probably assume an important role in administering the mobility-rights guarantees. In so doing, they will become deeply involved in the task of reconciling national and provincial interests and citizens' rights. One observer has suggested that in determining the reasonableness of provincial actions limiting personal mobility, the courts will be obliged to balance the interests of the national community against the more particular interests of the local community:

> *There may then be no alternative to a balancing approach under which barriers to mobility will be unconstitutional unless the benefits created by their promotion of local interests demonstrably outweigh the burdens they impose on interprovincial mobility.*[17]

Commissioners also wish to note that even in circumstances where a province invokes its powers to limit the availability of mobility-rights guarantees, the federal government may still have considerable influence over the provision of mobility opportunities within that province. For example, the federal government might decide to prohibit mobility discrimination as a condition of provincial participation in programs that are jointly funded, or to attach comparable conditions to monies transferred to the provinces. However, the fact that limitations on mobility rights now have a constitutional status they lacked before may make it politically more difficult for the federal government to secure contractual agreements overriding them. With respect to its own employees and employment practices, the federal government may, of course, establish its own practices, and possibly attach similar conditions to companies which work on federal contracts.

The Charter and the Politics of Rights

The Charter provides new opportunities for the involvement of Canadians in public decision making. Based on its provisions, members of the public can question the actions of governments as they affect fundamental rights and freedoms of citizens. This is a new feature in the Canadian political process. Formerly the main judicial protections against legislated interferences with civil liberties and human rights were found in the division of powers. This division between the spheres of federal and provincial constitutional authority was often invoked to prevent one level of government from acting, even if such actions would be permissible if undertaken by the other level of government. Limited resort to the Canadian Bill of Rights was also available to protect rights at the federal level, as were less reliable arguments about an "implied" bill of rights in our parliamentary tradition which was also relevant to matters in provincial jurisdiction. More often, questions of fundamental rights violations simply were not raised before the courts.

Citizens now have a wide range of grounds from which to argue the violation of basic rights and freedoms. While the Charter selectively recognizes the supremacy of Parliament or the legislatures, this supremacy must be explicitly invoked by the legislatures either under the general override clause or under provisions qualifying mobility rights or permitting affirmative action programs. Furthermore, a court must be satisfied that the legislated schemes are reasonable and demonstrably justified. Thus the Charter provides important new opportunities for determining the limits of legislative authority.

During the three years that the Charter has been in effect, most of the visible action in establishing these limits has occurred in the judicial arena. Nonetheless, governments are already guided by the Charter in their day-to-day deliberations about new legislation and amendments to existing statutes and regulations. While the Charter may not appear to be in the forefront of the legislative process, it can never be far from the minds of the lawmakers.

As lawyers and their clients seek new interpretations and applications of the Charter in the courts, Canada will undoubtedly become a more litigious society. The Charter will also contribute to a greater consciousness of fundamental rights in Canada, among citizens and governments alike. In addition, the Charter may contribute to improving the democratic parliamentary process by providing a new incentive to discuss legislation fully, in terms of its implications for the rights and freedoms of citizens.[1] Thus, Commissioners believe that the Charter will alter the conduct of politics, both directly by bringing to bear on political decision making the spectre of judicial constraint and less directly by furthering the development of a political culture predisposed to review government actions from the perspective of the rights of citizens.

The Charter offers incentives to Canadian interest groups possessing the resources and the will to sustain costly and lengthy court proceedings. In the past, these groups have not made extensive use of constitutional litigation as a tactic in seeking to bring about a policy change. While various interest groups have challenged government regulatory policies sporadically, on grounds of federalism, there has been no Canadian parallel to the American interest-group practice of initiating "test cases" supported by "legal defense funds". This lack is no doubt explained by the previous absence of significant constitutional prohibitions other than the federal division of powers, and the Canadian legal community's widely-held perception that policy making was not the proper business of the courts.

Some groups, however, have already begun to organize for such litigation. The recently established Legal Education and Action Fund for women is a good example. Its supporters hope that this fund, inspired by the successful example of the American Legal Defense and Educational Fund, Inc. of the National Association for the Advancement of Colored People (NAACP) and other similar programs in the United States, will ensure that women derive maximum benefit from the equality rights set out in the new Charter. This hope is premised on the belief that collectively supported efforts on behalf of women will be more effective than the individual legal initiatives women have undertaken in the past.[2]

Some groups and individuals will use the Charter to introduce issues to the political agenda and to advance particular causes in public proceedings. Is there a possibility that claims for entitlements based on the Charter will be over-used? Some may consider that the broad and general language of the Charter's principles provides almost unlimited possibilities for constitutional arguments across virtually all of public policy. Judicial decisions will contribute to setting limits to these possibilities and procedures, and the courts' early judgements will be crucial. But what will the public's attitude be toward use of the Charter? Will the Charter's emphasis on rights-based citizenship become the foundation for rights-seeking political behaviour?

Commissioners believe that the Charter will affect the ways Canadians think about and discuss politics. Over the past few decades, a popular language of citizens' rights has begun to emerge in Canada, and it has already affected political behaviour across a wide range of issues. In what ways, then, will the Charter's guarantees of rights affect the day-to-day political behaviour of citizens? Some analysts have argued that a strong tradition of rights seeking can erode the moral basis of a community and undermine considerations of duty and obligation. They suggest that the language of rights can lessen the willingness of community members to view their own rights in a balanced relationship to the rights of others and to the consensus underlying the community as a whole. In the broader context of the so-called "inflation" of human rights, one political philosopher has recently argued that rights-seeking behaviour and the advancement of rights claims on the basis that human rights are justified by natural law can disrupt the normal process of political bargaining and discussion:

> *Those who advance political claims under the aegis of human rights, believing that their causes are sanctified by the most powerful of all moral considerations, are in no frame of mind to negotiate ... Confronted by such massively heavy artillery, opponents of causes whose advocates invoke human rights are virtually compelled to resort to unduly heavy weaponry themselves ... The human rights perspective tends to extend political controversies beyond their plausible limits and thereby inhibits reasonable political debate.*[3]

Such a perspective does not depend on the legal or constitutional recognition of such rights; rather it presents essentially political claims as human rights. However, Constitutional recognition of a wide range of citizens' rights, many expressed in very general terms, can provide extra ammunition for those advancing such claims.

A seasoned federal public servant recently speculated about the challenges, as he saw them, of governing in a rights-seeking society:

> *The exquisite refinement of the overall field of human rights into a multitude of rights-seekers and rights-protectors has been a major development over the past ten years, and as the principal growth industry in government, rights have become a major preoccupation of public administrators . . .*
>
> *Canada is in danger of becoming a rights-ridden country . . .*
>
> *There is very little that can be done to contain the growth of the rights movement, given the difficulty of justifying opposition to any kind of right.*[4]

Commissioners do not wish to overstate the consequences of these developments. The Charter also expresses traditions of community values, and its tests of reasonableness and demonstrable justification clearly indicate that rights will not be extended on an unlimited basis. In the last analysis, however, only the citizenry itself can restrain the potential excesses of rights-bearing citizenship. The success of any charter of rights in enhancing the quality of citizenship relies at least as much on the degree of sophistication and responsibility that citizens bring to their use of the document as on its interpretation and enforcement by the courts.

In educating the Canadian public concerning their rights and freedoms, the Charter emphasizes the need for constant balancing between the reasonable and justified needs of the community and respect for the rights of its individual members. However, the Charter has clearly and appropriately shifted the balance in favour of the constitutional protection of the rights of citizens in their relations with governments. Certainly the benefits of this shift derive from an alert, fair-minded, and responsible citizenry, acting both individually and collectively in its political and legal affairs. It is good to be aware of the consequences that can follow when that trust is violated. But Commissioners believe that such awareness will reinforce Canadians' commitment to ground our community's future in the protected rights of individual citizens, and that it will strengthen the community as a whole. Similarly, such awareness will strengthen Canadians' resolve to protect and respect the rights of others and the collective needs of the community as a whole. Commissioners wish to emphasize that the Charter has provided a new defence for the protection of rights in Canada. Although the federal-provincial division of powers will remain important in some alleged violations of rights and freedoms, it will no longer bear the same responsibility. The Charter has placed protection of citizens' rights on a more independent footing in the Constitution.

Equality Rights and the Charter

One of the recurring themes put forward at this Commission's hearings and a central message from representatives of women's groups, aboriginals, visible minorities and the handicapped was that Canada must work harder to become a society marked by more equality. Many of these groups challenged traditional notions of equality and outlined an interventionist role for governments in creating circumstances that would help individuals and groups to share the opportunities, benefits and burdens of Canadian society more fairly.

We Commissioners discovered at our hearings what is confirmed in the massive literature on equality: the understanding of equality has changed substantially at the popular level over the past few decades. The guarantees of equality rights recently incorporated in the Canadian Charter of Rights and Freedoms reflect many of these changes. The Charter-making process itself benefited from some of the most sustained and highly focused debates on equality ever to occur in Canada during the public hearings before the Special Joint Committee of the Senate and of the House of Commons on the Constitution of Canada.

There has been a significant shift in emphasis from procedural equality, that is equality before the law, to more substantive notions of equality. Many advocates of procedural equality hoped that prohibition of overt discrimination would secure equal opportunity. However, more and more Canadians have come to adopt the view that while removing procedural barriers is a necessary step towards equality, it is not a sufficient one. Social, cultural and economic conditions are obstacles to equal opportunity. In fact, many groups and individuals argue that equality includes not merely equal opportunity, but equal enjoyment of the outcomes and benefits of those opportunities. Notions of substantive equality address these concerns. The increased efforts of governments to combat the causes and effects of discrimination, and to ensure a more nearly equal distribution of the opportunities and benefits of Canadian society relate directly to this new concern for substantive equality.

By challenging traditional notions of equality, recent debates have forced reconsideration of some long-standing justifications for setting limitations on equality. Canadians have had to examine more closely common assumptions about inequality. During our hearings, we Commissioners heard that widespread social values and attitudes are at the root of persistent inequality in Canadian society, and that changing these values and attitudes should be an integral part of efforts to promote equality.

Equality has always been a powerful idea in democratic societies. The basic nature of any political community is reflected in its treatment of the issues associated with rights to equality. We Canadians can learn a great deal about the nature of our community by examining closely the guarantees of equality found in section 15 of the Charter. As with other powerful social ideas, however, equality is controversial, and the Charter's guarantees of equality will continue to provoke political debate and legal and political activity.

Guarantees of equality are only one part of the Charter. Interpretations of other sections of that document will affect the interpretation and application of the equality guarantees. Of particular importance are the "reasonable limitations clause" (s. 1) and the "general override provision" (s. 33) which allows federal and provincial governments to override guarantees of equality.

Although section 15 sets out the Charter's basic equality rights, other sections may be directly relevant to the interpretation of the equality guarantees. For example, the sexual-equality guarantee of section 28 provides that: "Notwithstanding anything in this Charter, the rights and freedoms referred to in it are guaranteed equally to male and female persons." Section 28 applies to all rights covered in the Charter. Section 27, reviewed above, refers to the preservation and enhancement of Canada's multicultural heritage, while section 25 states that the guarantees set out in the Charter do not abrogate or derogate from any treaty or aboriginal rights pertaining to Native peoples. Sections 16 to 23 provide for the use of official languages and for minority-language education – cornerstones of equality programs for official language groups – and protect certain rights respecting other languages in Canada. In the absence of judicial interpretations of the Charter's equality guarantees, Commissioners can only speculate on their ultimate effect. We believe, however, that all of these provisions contain some signposts of the Canadian commitment to equality.

Section 15: Equality Guarantees

The guarantees of equality contained in section 15 of the Canadian Charter of Rights and Freedoms came into effect on April 17, 1985. The section reads:

> ***Equality Rights***
>
> *15(1) Every individual is equal before and under the law and has the right to the equal protection and equal benefit of the law without discrimination and, in particular, without discrimination based on race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.*
>
> *(2) Subsection (1) does not preclude any law, program or activity that has as its object the amelioration of conditions of disadvantaged individuals or groups including those that are disadvantaged because of race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.*

In effect, four guarantees of equality are presented in section 15(1): equality before the law, equality under the law, equal protection of the law, and equal benefit of the law. These four guarantees and the relevant provisions previously mentioned indicate that the constitutional order now embodies a very broad definition and concept of equality.

The guarantee of equality before the law is similar to that set out in the Canadian Bill of Rights. Our courts have interpreted the Bill of Rights as requiring equality in enforcement and application of laws. This guarantee is fundamentally important to procedural equality, but critics view its restriction to matters of procedure as a basic weakness. By 1982, there was a strongly perceived need to supplement this guarantee of procedural equality with rights of a more substantive nature.

The guarantee of equality under the law as stated in the Charter made clear that the guarantees of equality applied to the substance of legislation. Earlier the courts had interpreted equality before the law to apply only to the administration of the law. They had concluded that inequality in legislation itself was beyond the reach of the Bill of Rights. That interpretation severely limited the effectiveness of earlier guarantees of equality: it permitted legislatures to make distinctions on the basis of sex or race, or on other grounds, as long as the law was administered equally.

The guarantee of equal benefit of the law in the Charter avoids situations in which individuals could be deprived of basic legislative benefits. The new guarantee is intended to overcome unfortunate precedents. The Bliss case concerned a woman who had worked enough weeks to qualify for regular Unemployment Insurance benefits, but not long enough to claim maternity benefits.[1] Because her inability to work was the result of pregnancy, she failed to qualify even for regular Unemployment Insurance benefits. The court held that there was no denial of sexual equality: the discrimination was not between women and men, but between pregnant women and everyone else, a form of discrimination that was not prohibited. The court said also that the case had to do with benefits and that, in its opinion, the Bill of Rights did not contain a guarantee of equal benefits. Women's groups and others rejected this interpretation and fought successfully for the stronger guarantee now explicitly found in the equal-benefits provision of the Charter.

The right to equal protection of the law again echoes the Bill of Rights, although the latter guaranteed only the right to "the protection of the law". There has been little jurisprudence on this provision. An aspect of discrimination that may be encompassed by the equal-protection clause, but that is not included under the other guarantees is discrimination resulting from laws that appear to be neutral, but that have discriminatory effects. We shall review shortly the systemic discrimination that can result from these seemingly neutral practices.

Section 15(1) further states that these equality guarantees apply without discrimination and, "in particular", without discrimination on the basis of race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability. The enumeration of some specific characteristics raises several questions. Can individuals complain about a denial of equality based on other grounds? If so, will the test for the validity of the challenged actions differ from the one applied in cases where discrimination on one of the enumerated grounds is alleged? For example, will the courts act against discrimination on the basis of age, which is enumerated in section 15, more stringently than against discrimination on the basis of sexual preference, which is not specifically mentioned? If there is such a scale, what is the principle for ranking the grounds?

The use of the phrase "in particular" in section 15 suggests that the list of grounds on which discrimination is prohibited is open-ended: while section 15 lists specific grounds on which discrimination is prohibited, this list is not exhaustive. If the courts follow the jurisprudence under the Bill of Rights, they will probably give protection on enumerated grounds. Will they treat non-enumerated grounds differently?

An individual arguing denial of equality rights on some ground not specified in section 15 might have to show that the specific ground deserves constitutional protection; such a requirement places an additional burden on the individual. The courts may prove to require substantial evidence before finding that legislation discriminates on the basis of non-enumerated grounds.

The courts will obviously be the central actors in establishing the application of section 15(1) of the Charter. But governments themselves can bring their own laws into conformity with the spirit of the Charter's provisions, especially where they become aware of discriminatory practices. Attitudes to equality change: one generation's idea of equality may seem discriminatory to the next. Where attitudes and understanding change beyond the established requirements of the Charter, governments, perhaps better than courts, can ensure that laws conform to the broad spirit and objectives of the Charter's guarantees.

Like the other rights guaranteed by the Charter, equality rights are not absolute. Some limitations on equality have received general support in the past: limits on various age groups, for example, in matters such as the age of majority, voting age and mandatory retirement. The equality guarantees in the Charter are subject to the general override power of legislatures, which means that governments can legislate notwithstanding the general constitutional guarantee of equality. The active constraint on governments in such instances is public opinion; in fact, governments need defend their actions in this regard before no other court. Where governments have not explicitly overridden an equality guarantee, the judiciary may itself consider whether a limitation is demonstrably justified, given the norms and traditions of a free and democratic society.

Thus two processes will shape the evolving meaning and scope of the Charter's equality guarantees. First, public opinion expressed through the political process may support recognition of new groups in terms of the equality guarantees, and will also condition the authority of governments to place restrictions on established equality rights through use of the general override provision. Secondly, judicial interpretation of the equality guarantees and of the justified limitations on equality in the context of a free and democratic society will have important effects.

The possibility of a scale of protected interests or grounds on which discrimination by governments is constitutionally prohibited will require further careful consideration. Some analysts have suggested that an approach developed in the United States may be useful. The equal-protection clause in the American Constitution does not enumerate specific grounds of prohibited discrimination. Thus, U.S. courts have had to determine, with reference to American history, which grounds are the most invidious and to devise standards to apply in scrutinizing offending legislation. Strict judicial scrutiny is usually applied to legislative distinctions based on race and nationality, for example. This means that the courts will strike down a law that discriminates on such grounds unless the government can demonstrate that it is pursuing a compelling end, and that the discriminatory classification is necessary to promote that interest. Where sexual discrimination is alleged, the courts have applied an intermediate test of scrutiny. Here, the discrimination imposed by a law must be substantially related to an important government interest, or else the courts will hold it to be an unconstitutional violation of the equality clause. The courts have devised a minimal-scrutiny test for legislation that discriminates on other grounds. Under minimal scrutiny, the American courts require simply that the classification rationally be thought to bear a relationship to a constitutionally permitted objective of government.

In Canada, the constitutional framework for the protection of equality differs from that of the United States. Our Charter explicitly provides that race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability are worthy of constitutional protection. However, a legislative distinction based on age may not require the same degree of justification as one based on other enumerated grounds. For instance, there may be demonstrably justifiable government objectives related to distinctions based on age that would not be acceptable on the basis of racial classifications. The protection of children is a possible example. It appears to be possible within the framework of section 15 of the Charter and the general limitations clause contained in section 1 to recognize different degrees of justification.

Other sections of the Charter may affect the degree of constitutional protection accorded to members of a particular group. They may enhance or detract from protection relating to the classifications set out in section 15. The separate requirement that all the rights in the Charter apply equally to men and women (s. 28), for example, will probably strengthen the prohibition of discrimination on the basis of sex. Similarly, the guarantees of religious equality in section 15 may be strengthened by the general guarantee of freedom of religion as a "fundamental freedom" elsewhere in the Charter. Nevertheless, the constitutional protection given to denominational schools may restrict or qualify those rights. In addition, while section 15 guarantees equality without discrimination on the basis of age, the Constitution Act, 1867 places upper age limits on members of the Senate and members of the superior courts.

Thus we Canadians may not need to adopt the three levels of scrutiny developed in the United States, but our courts may require different degrees of justification for protecting various types of equality.

Equality and Ethnicity

As with the Bill of Rights which preceded it, the Charter prohibits discrimination on the basis of race and national or ethnic origin. Unlike the Bill of Rights, however, the Charter also outlines circumstances in which such distinctions become relevant for the rights of Canadians. It does so in the matter of language guarantees. While "national origin" and "mother tongue" are certainly not synonymous, the guarantees of minority-language education make distinctions among new Canadians largely, if indirectly, on the basis of their national origin, just as the guarantees also distinguish between Canadians who claim neither English nor French as their mother tongue and those who do.

The protection of aboriginal and treaty rights in the Charter may be a better example of the conflict that can arise between the equality rights of individuals and rights recognized on the basis of ethnicity. Sections 35 and 37 of the Constitution Act, 1982 and section 25 of the Charter recognize aboriginal and treaty rights. Some comments will illustrate the collective nature of these rights, and their potential conflict with the spirit of other sections of the Charter and with equality rights in particular. The Constitution Act, 1982 contains no directly comparable provisions for other groups.

In addition to recognizing and affirming aboriginal and treaty rights, section 35 of the Constitution Act, for the first time in Canadian history, recognizes Métis people, together with Indians and Inuit, as the aboriginal peoples of Canada. As amended following the Constitutional Conference of First Ministers in March 1984, section 35 guarantees all aboriginal and treaty rights referred to in this section equally to men and women. Through this amendment, section 35 now conforms with the Charter's provision of sexual equality. The innovative section 37 of the Constitution Act, 1982 provided for aboriginal participation in future discussion of constitutional matters that directly affect the aboriginal people of Canada. The consequent meetings were "a first" in Canadian history: in addition to the First Ministers, the leaders of major aboriginal groups attended.

Section 25 of the Charter provides that the Charter shall not be interpreted in a manner that abrogates or derogates from aboriginal rights. This section does not attempt to create new rights. As with certain other provisions in the Charter – those pertaining to language (s. 21) or to other rights not specified in the Charter (s. 26) – the function of section 25 is to ensure that the Charter does not diminish any rights and freedoms existing independently of it. As amended in 1984, section 25 provides that:

> *The guarantee in this Charter of certain rights and freedoms shall not be construed so as to abrogate or derogate from any aboriginal, treaty or other rights or freedoms that pertain to the aboriginal peoples of Canada . . .*

Several questions arise from the provisions on aboriginal rights in the Charter. Can section 25 be used to challenge existing laws that have limited or taken away treaty or land-claim rights? The courts will have to answer this question. More generally, how can, and how should, we balance the individual rights of all Canadians with the collective rights of some groups within the broader national community? Canadians as a whole will have to answer this type of question.

The dominant political culture in North America places great emphasis on the protection of individual rights and freedoms. In Canada, we can see that emphasis embodied in the 1960 Bill of Rights, in provincial and federal human rights legislation and, since April 1982, in our Charter. The aboriginal cultures, however, have a quite different emphasis. The 1981 Report of the Métis and Non-Status Indian Constitutional Review Commission, entitled *Native People and the Constitution of Canada*, states:

> *. . . the dominant socio-cultural system in Canada is liberalism which places emphasis on the individual, individual rights and private property. This is in*

> *contrast to the value system of Native peoples which places a far higher value on the collectivity or upon the community. It is ironic that non-Native Canadians, with all their liberal ideological baggage, cannot understand the significance to the Native peoples, or for that matter to any self-conscious minority group of being recognized as a collectivity. They do not realize that a cultural minority faces certain death by assimilation if the political system forces it to deal with the majority culture as individuals.*[2]

It is from these different and, to a degree, conflicting cultural premises that problems arise in the protection of individual rights within the context of aboriginal communities.

When individual and collective rights conflict, which value system will prevail? Will it be the non-aboriginal Canadian society or the aboriginal community? What would happen if a member of a self-governing aboriginal community challenged that community's collective decision on the basis of his or her individual rights as enshrined in the Charter of Rights and Freedoms? Some analysts have argued that the purpose of section 25 is to ensure that aboriginal rights prevail over other provisions in the Charter.[3]

Aboriginal self-government, intended to provide protection for collective rights, introduces complexities for the protection of individual rights within the jurisdictional domain of aboriginal governments. Aboriginal organizations are particularly sensitive to this issue and recognize the need to balance individual and collective rights.

Some would argue that all individuals within aboriginal communities should be entitled to the full protection of the Charter and of the Canadian courts, that the Charter should apply within the jurisdiction of aboriginal governments as it applies within the jurisdiction of the federal and provincial governments, and that individuals should have access to independent appeal procedures. As Commissioners have argued in our section on aboriginal self-government, members of aboriginal communities should retain their rights as Canadian citizens. We view the Charter as contributing to a definition of Canadian citizenship. To exempt aboriginal communities from the individual-rights guarantees of the Charter would be to diminish fundamentally the citizenship of aboriginal Canadians.

The longstanding controversy over section 12.1.b of the Indian Act, which penalized Indian women who married non-Indian men by requiring them to forfeit their Indian status, demonstrated that these concerns about individual and collective interests are not simply abstract issues. They do arise in practice. Conflicts between collective rights, aboriginal rights and individual rights will arise; individuals living within aboriginal communities will appeal to external forms of protection. The manner in which such conflicts are resolved is integrally related to our sense of Canada.[4]

The multiple purposes of the Charter are the source of potential conflict between individual and group rights. The Charter not only encompasses the individual rights of Canadians, but it also addresses contemporary concerns about national cohesion. Earlier, Commissioners examined how the accommodation of provincial communities, both through the specific provisions respecting personal mobility rights and the general override provision, may interfere with the mobility of individual Canadians and with other rights guarantees. We noted that over-use of these legislative powers could introduce so much variation across the country that the concept of individual rights in a national community could be undermined. We accepted that provisions for variation reflect the historic reality of the Canadian community and argued that recourse to these provisions will be moderated by the spirit of the Charter. The Charter recognizes certain fundamental rights and freedoms of Canadians in constitutional terms. This new status for citizens' rights requires that departures from stated constitutional norms be justified by those who have the authority to introduce such departures.

Commissioners believe that the provisions underlying the special status of various cultural groups in Canada can be understood on the same basis. The multicultural design of Canada, the official status of two languages, and the more recent official affirmation of aboriginal rights reflect deliberate choices worked out by the political process. Canadians value the cultural distinctiveness of our various ethnic communities, and we have self-consciously styled ourselves a country of immigrants; at critical points in our national history, we chose to develop as a bilingual nation, where mother tongue would carry certain special rights. Yet this celebration of group differences is at best only half of our personality. We are also a society of individuals, nurtured by the traditions of democratic liberalism. In such a society, one does not interfere lightly with the equality of citizens. Neither is the celebration of our group differences a justification for denying opportunities for individuals to develop their abilities to the full. Appropriately, section 15(1) of the Canadian Charter of Rights and Freedoms makes a broad and general guarantee of the equality of every individual and prohibits discrimination based on such grounds as race and national or ethnic origin. This is Canada's fundamental commitment to equality.

The Affirmative Action Clause

Section 15(2), a counterpart of section 15(1), protects governments from constitutional challenges in instances where they have taken positive action to rectify situations where groups are at a disadvantage because of past discrimination. Section 15(2) represents an exemption from subsection (1) where the object of a law, program, or activity is to ameliorate conditions of disadvantaged individuals or groups. This provision was included in the Charter to avoid problems which occurred in the United States when affirmative action programs were introduced. In a number of decisions, the U.S. Supreme Court ruled these programs unconstitutional. They were deemed to constitute a form of reverse discrimination contrary to the equal-protection guarantees. To avoid these problems, the framers of the Canadian Charter made it clear that any affirmative action program with the appropriate objective would be exempt from section 15(1).

Section 15(2) does not require that governments take affirmative action, although it is conceivable that the courts, through the remedies section of the Charter, could require that an affirmative action program be initiated in order to remedy past discrimination. While the courts could do this, section 15(2) provides a valuable mechanism for governments to take initiatives toward the attainment of equality in Canada.

In an earlier chapter of this Report, Commissioners concluded that affirmative action is useful for achieving greater equality of opportunity and wage parity for men and women in the labour force. Affirmative action can also be used to combat discriminatory attitudes and to provide role models for disadvantaged groups. In recent years, it has become more popular as an instrument for combatting what is now commonly referred to as "systemic discrimination". The recent Royal Commission on Equality in Employment (the Abella Commission)[5] recommended mandatory affirmative action programs, both federal and provincial, for improving equality of opportunity for employment for women, the handicapped, visible minorities and Native peoples. Similarly, the recent Special Committee of the House of Commons on Visible Minorities[6] recommended the establishment of voluntary affirmative action programs to assist visible minorities to overcome systemic discrimination. In 1981, the Special Committee on the Disabled and the Handicapped[7] recommended that federal government departments, agencies, and Crown corporations expand or implement affirmative action employment programs for the disabled. In the past, this technique has also been used to promote the participation of francophones and Native peoples in the public service, as well as the participation of the disabled and of women.[8]

In this Commission's hearings, many groups and individuals spoke about various forms of systemic discrimination. This form of discrimination is invisible and often unconscious, having grown up over time and become embedded in our culture. It is different from overt discrimination, which manifests itself in clearly expressed prejudice. Overt discrimination occurs, for example, when a property owner says "I will not rent my apartment to a family on welfare," or an employer says "I will not hire a woman." This kind of discrimination is prohibited by law, and a victim of such prejudice can seek redress with Human Rights Commissions and through other legal protections. Systemic discrimination is of a different kind; it can operate unconsciously so that individuals may not be aware that their attitudes and behaviour systematically exclude or discriminate against some people. For example, seemingly neutral job requirements such as standards of height and weight may constitute a barrier to whole sections of society.

Systemic discrimination cannot be easily eliminated. To alter discriminatory attitudes and traditions involves changes in our public and economic institutions and practices, as well as in our personal lives. For instance, some participants in our hearings argued that to equalize employment opportunities for women requires that we, as a society, collectively change practices and attitudes toward family responsibilities, child care and the division of domestic work. It requires, as well, that we change early socialization and educational patterns by which we encourage one set of values for boys and another for girls. The Canadian Advisory Council on the Status of Women told us that the time has come for a re-examination of our societal attitudes and practices in these areas:

> *Education, adult training, community facilities, working hours, and support services for families with children must be re-examined to see how they are influenced by the stereotype of the traditional family, in which the woman devotes all her time to ensuring the well-being of the other members. These biases must be corrected, and we must change our social organization so that a mother can find the independence and financial security she needs in the labour market just as easily as a father can. The cooperation of all levels of government and the participation of all economic agents will be needed to bring about this transformation.*
>
> (Canadian Advisory Council on the Status of Women, Brief, November 30, 1983, p. 44.)

To be sure, there has been much progress on these matters in recent years, within families, in school counselling, in university-enrolment patterns and elsewhere. Public awareness of these matters is an important first step in the direction of greater equality. And in recent years, a growing number of community services and support networks have sprung up across the country to assist people who experience systemic discrimination. In our hearings, testimony abounded about the useful services these voluntary organizations provide. But these same intervenors were adamant that to rely on voluntary agencies and individual self-help is not enough. Active government involvement is required to eliminate systemic discrimination. There are several reasons for this.

First, the process would occur more quickly with effective government leadership. Without concerted government action, individuals continue to suffer the effects of discrimination for longer than is tolerable or necessary. In October 1984, the Report of the Royal Commission on Equality in Employment called for a "massive policy response to systemic discrimination".[9]

Secondly, as the Saskatchewan Action Committee on the Status of Women reminded Commissioners, the issue of equality is one which the whole of society must address:

> *The women's question . . . is one that needs to be addressed by all of us, not just women . . .*
>
> *Women's issues, which basically are concerned with how we can operate on a basis of equality and independence in all aspects of society, have to be taken seriously, and it is our belief that this calls for nothing less than the restructuring of society, so that women, as society's largest minority, will have a chance to participate.*
>
> (Saskatchewan Action Committee on the Status of Women, Regina, Transcript, November 24, 1983 [vol. 5], pp. 10770–71.)

Failure to intervene can be regarded as tacit confirmation by government, and therefore by society as a whole, that we accept the existing patterns of discrimination. As the Abella Report argues:

> *If we do not act positively to remove barriers, we wait indefinitely for them to be removed. This would mean that we are prepared in the interim to tolerate prejudice and discrimination. By not acting, we unfairly ignore how inherently*

> *invalid the exclusionary distinctions are, and we signal our acceptance as a society that stereotypical attributes assigned to these... groups are appropriate justifications for their disproportionate disadvantages.*[10]

Finally, if groups or individuals have been disadvantaged in the past, it is not possible to make them equal simply by removing obstacles. For example, when the "separate but equal" doctrine relating to race and education facilities was declared an infringement of equal-protection guarantees in the United States, it did not immediately put Blacks on an equal footing. Years of discrimination, resulting in inferior education, meant that Blacks, on average, could not meet many job standards which were based on "white" educational norms.

The Canadian constitutional guarantee of equal protection of the law, combined with the affirmative action provision, allows governments to intervene against systemic discrimination. Section 15(2) of the Charter can serve as a mechanism by which governments can promote equality. In the first instance, such programs would have effect in the public service and throughout "government", as provided in the Charter's application section.

Although affirmative action is an appropriate means to combat many forms of systemic discrimination, we Commissioners do not wish to imply that it is a panacea for all disadvantaged persons. Affirmative action, as our review in the context of social security (Part V) indicated, is also not without costs to society.

It remains essential to retain and improve measures to equalize opportunities within, as well as among groups. For this reason, affirmative action proposals in labour markets are often accompanied by proposals to improve access to training and employment for the most disadvantaged members of a given sub-group.

A related policy difficulty is defining the disadvantaged group. Statistical categories can be very misleading. "Visible minority" may be one such category. Recent research indicates that on many scores – education, income, mobility, standards of living – there is a great variation among groups defined as "visible minorities". For example, male Filipinos (60 per cent) and Koreans (57 per cent) are much more likely to have attended college or university than Blacks (26 per cent) or Natives (17 per cent). Similarly, in 1980, the salary range of "visible minorities" varied widely: Canadian-born male university graduates of Japanese origin were likely to earn an average salary of $28 202 and their Chinese counterparts a comparable $24 370, in contrast to Canadian-born male university graduates of Indo-Pakistani origin whose average salary was $13 186. These data suggest that programs which do not distinguish among "visible minority" groups may not be directing benefits towards those who need them most.[11]

A further serious drawback to affirmative action – one that must continuously be weighed in the minds of legislators who introduce such programs – is that in favouring one group, they discriminate against another. The Charter permits this discrimination, and Commissioners believe that when a community decides to rectify the situation of its disadvantaged members, it is appropriate that such actions not be barred by the Constitution. Constitutional permission does not, however, resolve the difficult moral issue that must be faced: Does the desire for group-based equality of results justify the inevitable interference with individual equality of opportunity?

In some situations, systemic discrimination warrants the use of techniques such as affirmative action. Above all, however, Canada is a society committed to individual equality of opportunity. Short-term programs that interfere with this principle are acceptable only because Canadians believe that in the longer run, they contribute to genuine equality of opportunity for all citizens.

This Commission agrees that circumstances exist where inequalities are directly related to membership in some identifiable group within Canadian society. In such circumstances, steps can and should be taken to ameliorate the general conditions of inequality. We wish to emphasize, however, that equality ultimately applies to individual Canadians. The main redress for inequalities and the major emphasis on ensuring equality of opportunities for all Canadians should therefore be through government action in support of the individual as such, and not because he or she is a member of some particular group.

The Supreme Court of Canada and the Constitution: Institutional Implications

The Supreme Court of Canada faces demands on its decision-making capacity because of the federal character of our country, differing views on the limits of public action, the evolution of private law, and the introduction of the Canadian Charter of Rights and Freedoms.[1] A number of analysts believe that under the Charter, more policy decisions will be made by Canadian courts. Some, indeed, speak of the "politicization" of the judicial process, and suggest that we should anticipate its continuation. This process partly reflects the gradual "legalization" of society, for since the Second World War, more and more issues which have been drawn into the arena of public debate and conflict find their way to the courts for judicial resolution.

The demands made on the Supreme Court have implications for the structure and design of the judiciary. Commissioners do not believe that the institutional issues of the judiciary are a major national priority for reform. They are important, however, particularly as the role of the Court is seen to be expanding. In our brief review of the major issues, Commissioners wish to underline the need to be sensitive to the character of the judicial process and to the particular responsibilities of courts in our overall institutional framework.

Federalism, the Charter and the Composition of the Supreme Court

Conflicting views about the nature of Canadian society have often focused on the judicial process. Canadian federalism, involving two orders of responsible parliamentary government with overlapping jurisdictions, imposes on the Supreme Court of Canada obligations to decide constitutional matters. The abolition of civil appeals to the Judicial Committee of the Privy Council (JCPC), in 1949, meant the replacement of an external umpire by a Canadian tribunal appointed in accordance with a statute of the Parliament of Canada. At that point the Supreme Court assumed final responsibility for Canadian constitutional interpretation.

In the 1950s and 1960s, little constitutional conflict arose over the division of powers. In the 1970s, however, heightened intergovernmental conflict and increased reliance on regulatory powers greatly increased the volume of constitutional cases before the Court. Governments sought final resolutions or enhanced bargaining power, and private litigants tried to use the distribution of powers to constrain state intervention. On contentious matters, such as energy and constitutional reform, the Court's decisions have been of the highest importance. Inevitably, some observers have expressed concern about the legitimacy of the Court as a federal-provincial umpire. Could a court nominated by one order of government, they demanded, function as an impartial tribunal in division-of-power cases? Though studies of the Court's judgments since 1949 suggest that it has performed this difficult role in a balanced and sensitive manner, concerns of legitimacy continue to arise.

The Court's function in the federal system has given rise to various reform proposals, usually centred on the appointment process, and on the size and composition of the Court from the perspective of representation.

Regional representation was at the heart of most recent recommendations until the Charter of Rights brought new representational claims. At any given time since 1949, the Court has had no justices from five of the provinces and none from either territory. Since 1949, the Court has never included a judge from Newfoundland or Prince Edward Island, and for several decades did not include a judge from British Columbia.

Commentators have put forward claims for extended or more secure regional representation on the Supreme Court. If judges are selected from across Canada, the Court is more likely to be responsive to conditions and developments throughout the country. This argument supposes that a judge's connection with the law of a province or with regional conditions endues him or her with special knowledge of that region or province. This argument is an extension of concerns expressed by Canadians before 1949, when the JCPC in London served as the final court of appeal for Canadian law, including constitutional law. Such a regional pattern of judicial selection might better reflect the federal character of the Canadian Constitution and, it is argued, enhance the acceptability of decisions. Advocacy of this nature has been particularly extensive in recent years as a number of constitutional decisions of great significance to Canadian federalism have been placed in the hands of judges.

The suggestion that regional variations among the judges are important often meets with the reply that this regional quality is difficult to discern and even more difficult to bring to bear on the Court's decision making. Some observers have also criticized the suggestion because it takes no account of the differences within regions. British Columbians may wonder why, for Supreme Court purposes, they have been consigned to the same region as Alberta, Manitoba and Saskatchewan. Newfoundland does not have the same legislative, political, social or legal history as any of the Maritime provinces, yet most regionally oriented proposals would cluster all four provinces together for the purpose of selecting a judge. If geography and knowledge of local conditions actually are important factors in judicial decision making, then perhaps the appointments of justices from Quebec and Ontario should be geographically distributed throughout those two vast and internally diverse provinces. Perhaps members of the bench and bar from outside Toronto and Ottawa or Montreal and Quebec City, should be allocated seats on the Supreme Court bench.

Besides discounting intra-provincial differences, the regionalist approach to judicial appointments also tends to ignore judicial independence. The late Chief Justice Bora Laskin once remarked:

> *It saddened me that there was so little understanding manifested either about the nature of the Court's work or about the significance of the fidelity of its members to their oaths of office, so little appreciation of the importance of cohesion and collegiality in the dispatch of the Court's work. That work has no regional and, certainly, no political tie-in.*[2]

The Supreme Court deals "with national issues, with matters of general public importance that have no special regional connotation." The Court is a national institution, yet in a different sense from the Senate or the federal executive, upon whose actions it may sometimes be required to pass judgment. Furthermore, the argument in favour of emphasizing regional considerations in appointments may be weakened if the Court's role in deciding division-of-powers cases declines relative to its other responsibilities.

This Commission supports a view recently advanced by a leading student of the judicial process:

> *When we consider both the issues which the Supreme Court is called upon to decide as well as the nature of the adjudicative process, it is difficult to accept that the representation of regional interests either could be or should be prominent in the work of the Supreme Court. It seems very doubtful that there is a Western, or Atlantic or Ontario or Quebec position which must be articulated in the Court's deliberations if it is to make sound decisions on the subjects that are coming to dominate the Court's docket – namely, review of the federal administrative process, the interpretation of the Criminal Code and other federal statutes and disputes arising under the Constitution, including the Charter of Rights and the division of powers.*[3]

As the Canadian Bar Association Committee on the Constitution has pointed out, "A court is not a board of arbitration. It is a judicial body."[4] The members of the Supreme Court of Canada do not perform representative functions in the Canadian institutional and constitutional system. Judicial merit alone is the criterion by which the Court's membership and performance should be assessed. Accordingly, Commissioners reject arguments that the composition of the Supreme Court should be regionally representative. Existing provision in the Supreme Court Act for the appointment of Quebec members is based on the distinctive legal traditions of that province, and should be maintained.

Until recently, the Supreme Court's constitutional cases largely consisted of disputes or references about federal and provincial legislative jurisdiction. It was primarily in this context that relations between citizens and the state were adjudicated, although the Court did consider individual cases in relation to the Canadian Bill of Rights. The rise of Charter litigation will probably increase the number of cases involving citizen/state relations. In terms of successful motions for leave to appeal, Charter cases are already outnumbering other constitutional cases. This situation may give rise to new types of representational claims based on the social and economic characteristics of judges. Commissioners also reject these criteria for the selection of Supreme Court judges.

The Supreme Court Appointment Process

The process of appointment to the Supreme Court is frequently confused with the representation issue. That is, those who regard the Supreme Court as a representative body – a view Commissioners reject – also expect the appointment process to be representational. As new representational claims are made, the appointment process is likely to emerge again as a subject of public concern. We attribute the current relative lack of interest in this issue, which was observable in our hearings, to the high quality of appointments that have been made under existing procedures. Whatever new process may be adopted – and we see no urgent need to replace the current arrangements – the judicial merit of appointees should remain the central criterion.

The chief issue in the appointments process is the perception that it does not adequately involve the constituencies of our political system. Although the existing informal procedures which the Prime Minister follows before he makes appointments to the Supreme Court do involve extensive discussions, some Canadians consider that they take too little account of concerned interests or advice. Numerous options have been put forward.

The *Report* of the Royal Commission on Constitutional Problems[5] (the Tremblay Commission), published in 1956, suggested that provinces should participate in the nomination of Supreme Court judges. The Victoria Charter proposals of 1971 contained a complex formula for securing the agreement of federal and provincial authorities concerning any appointment to the Court. It was recommended that the Attorney-General of Canada consult the Attorney-General of the province with which a potential appointee has the closest connection. If the two failed to agree on an appointee, the Minister of Justice would propose establishment of a nominating council; the choice among possible forms of this council would rest with the provincial Attorney-General. The body would consist primarily of the chief federal and provincial law officers or their nominees. The federal Minister of Justice would submit at least three names to the Council, from which it would make a recommendation. The Special Joint Committee on the Constitution in 1972 endorsed the consultative method set forth in the Victoria Charter, but questioned its failure to allow the provinces to nominate candidates.

Some of Canada's legal scholars favour a form of consultation or collaboration, such as a permanent nominating commission to be used, not just for the Supreme Court of Canada, but for all superior court appointments. The commission could consist of Members of Parliament and of provincial legislatures, representating all political parties, and including non-lawyers. It would maintain a list of suitable prospective appointees from which the appointing authority would choose appointees.

The Constitutional Amendment Bill, proposed in 1978, embodied the proposals of the Victoria Charter and took them one step further. It provided that after the Attorney-General of Canada and the provincial Attorney-General had agreed, or after the nominating council had broken the deadlock over an appointment, the nomination would then be submitted for ratification to a new "House of the Federation" which would replace the existing Senate and would be more representative of our federal diversities. The House would be required to affirm or reject the nomination within a limited time.

Ratification of Supreme Court appointments by a reconstituted upper house gained adherents during the constitutional debate of the 1970s. The Government of British Columbia favoured nomination by the federal government, after consultation with the provinces, and ratification by a reformed Senate. The Canadian Bar Association Committee on the

Constitution, the Pépin-Robarts Task Force on Canadian Unity,[6] and the Beige Paper of the Quebec Liberal Party[7] have made similar proposals.

An Alberta proposal specified that only the provincial governments would suggest appointees to the special constitutional panel it proposed. The Pépin-Robarts Report recommended that the federal Cabinet be required to consult with Quebec's Attorney-General before filling a civil-law vacancy. Where a common-law vacancy occurs, the Cabinet would consult all other nine provincial Attorney-Generals about possible appointees. The variety of suggested reforms is large, but all assume consultation or negotiation with a provincial Attorney-General or provincial representation in a reformed national upper house.

As Charter cases come forward in greater numbers, Commissioners would expect proposals for appointment procedures based on social and economic grounds, just as earlier proposals advocated intergovernmental arrangements. Because the Supreme Court adjudicates cultural, economic and social issues, new methods of selection might assess all "relevant" qualities of a potential appointee. In a research paper prepared for this Commission,[8] the authors discuss the possibility of an Appointing Council that would survey likely candidates and decide who should be named to the Court. Ideally, the Council's members would be diverse in vocational background, age, economic and social status, ideological orientation and racial, ethnic and regional origin. Instead of choosing judges according to region or other sociological criteria, the Appointing Council itself could reflect a cross-section of Canada. Partisan and regional considerations would arise at the time of selecting the members of the Appointing Council, rather than at the stage of judicial appointment. Commissioners are unconvinced, however, that such drastic reform is needed.

The appointment process is inherently political in the broad institutional sense. Measures to shift responsibility from the Prime Minister to some designated group or institution necessarily involve replacing one political process with another. Consistent with our view of the role of Parliament, Commissioners believe that if revised arrangements are to supplement the existing political process of consultation through the Prime Minister, the modified process should involve Parliament and should be equally broad. The elected Senate we have recommended would be an appropriate body to perform the ratification function in a rearranged appointment process. An elected Senate would be both broadly representative and regionally sensitive and thus would largely meet the traditional concerns of the provinces and the socio-economic concerns emerging from the Charter of Rights and Freedoms.

Constitutional Status

While the Supreme Court has some degree of constitutional recognition, as set out in sections 41 and 42 of the Constitution Act, 1982, and in section 101 of the Constitution Act, 1867, it is a matter of controversy whether it is entrenched to the degree that changes in its fundamental features require action by both orders of government. There are several arguments supporting its more definite constitutional entrenchment. Some Canadians consider it inappropriate that the Court which adjudicates on the division of powers in the federal system is a statutory creation of the federal government. However impartial the Court's record, critics insist, its image of neutrality should be strengthened. Moreover, with the Charter only recently in place, we Canadians should ensure that nothing can block or obstruct judicial power to protect citizens' rights against unconstitutional government action. Constitutional status for the Court would confirm and safeguard its symbolic importance as defender of essential values in Canadian society.

Commissioners recommend explicit entrenchment in the Constitution of the status of the Supreme Court of Canada and, in particular, of its independence, although we believe it inappropriate to remove responsibility for the administration of the Court from the federal government.

Canada's Constitutional System and Unresolved Community Issues

Introduction

The political answer to the complex question of our identity as a people has never been static; nor have Canadians reached agreement in this matter. Yet governments, through institutional and legislative changes, must represent and respond to the pluralism of Canadian society even as the components of that pluralism shift in response to factors, often international, over which governments have little control. In 1985 there are pressing community issues on our agenda, several of which Commissioners consider below, together with proposed reforms.

Commissioners intend these reforms to produce a closer fit between the social dimensions of community and the institutional arrangements that express and incorporate them. The way we govern ourselves must reflect the national and provincial communities and the ever-emerging social cleavages within them. The reforms we propose reflect our understanding of the existence of a single Canadian people. A common citizenship brings together people divided by language, ethnicity, sex, province, life-style, income and other sources of diversity. We would like to help encompass these many groups in an institutional framework that does not smother distinctions or stifle conflict, but that does facilitate co-operation and the recognition that Canadians are one people.

The Constitution Act, 1982, with its Charter of Rights, its amending formula and its natural resources clause, was a compromise influenced, notably in the case of the Charter, by citizens' input. Although the Government of Quebec was not a signatory to the agreement that led to the Constitution Act, the Act's provisions are applicable to, and judicially enforceable in, that province. The Government of Quebec, the province that is home for over 80 per cent of French Canadians, does not view the Act as a legitimate part of the Constitution. Its concerns involve both the Charter and the amending formula. Other political forces in Quebec share these concerns in modified ways. The ground of division, therefore, is not going to go away.

Patriation and the Constitution Act are, accordingly, incomplete achievements. Quebec's unwillingness to agree to the constitutional changes recently introduced is the major unresolved community issue in Canada today. Given the apparent decline in "nationalism" in Quebec, Commissioners suggest that a sympathetic and sensitive response to the province might lead to constitutional *rapprochement*, and we make proposals with the intent of achieving that objective.

In general, the harmonious co-existence of French- and English-speaking Canadians, which would include appropriate institutional and constitutional recognition, requires effort at three levels. First, there must be recognition of the essential role played by the Government of Quebec in cultivating a flourishing French-speaking majority population. Secondly, the national government must reflect Canada's linguistic duality in its overall operations. Thirdly, Canada as a whole, in both its national and its provincial dimensions, must be responsive to, and supportive of, the official-language minorities, francophone outside Quebec and anglophone within.

In addition to institutional questions relating to Quebec and to French-speaking Canadians, other institutional questions arise that relate to Canada's northern territories, to aboriginal self-government and to municipalities. Several significant proposals for change in the organization and structure of governments in Northern Canada have been under consideration for some time. It is appropriate, in Commissioners' view, to encourage the continuation of the processes that are presently under way, with the intent of bringing the governmental arrangements of the Northern territories more into line with practices across the rest of Canada; at the same time, Canadians should implement measures that are sensitive to the distinctive social, economic and cultural features of the region.

In the matter of aboriginal self-government, Commissioners support the introduction of measures to increase the influence and control exercised by Native peoples over their social and economic affairs. This objective is based on the distinctive place aboriginals hold in Canadian society as the first peoples of Canada, and on the constitutional recognition which they now enjoy. It is by no means clear, however, that the implications and consequences of aboriginal self-government as they might affect Canada's overall governing arrangements have been examined with sufficient care. Indeed, there are several areas where further reflection is required.

Canada's local government arrangements vary significantly across the land. This diversity corresponds to differences in size and financial resources and to the fact that local government is constitutionally the responsibility of the provinces. Commissioners note, nevertheless, significant developments in the size, complexity and responsibility of local governments, and we believe that there are a number of measures to consider that would strengthen the capacity of municipalities to make the fullest contribution possible to Canadian society and economic development.

The Place of Quebec in Confederation

Since the beginning of the 1960s, the debate about Quebec's place in Confederation has given rise to considerable discussion in Canada. It is not surprising, therefore, that following the 1980 referendum and set against a backdrop of economic crisis, some Canadians concluded that the dispute had monopolized too much time, and that it should be set aside in favour of the study of other important questions of interest to all Canadians. In fact, with the coming into force of the Constitution Act, 1982, the argument about Quebec faded so far into the background that some Canadians concluded that the problem could solve itself, given an active policy which guaranteed each and every citizen equal linguistic rights. Later attempts to revive the debate seemed not only futile, but also hazardous. Yet, in a matter of a few years, the issue of Quebec's place in Confederation was back on the constitutional agenda. Indeed, circumstances had seldom seemed more propitious for the issue's resolution. The Government of Quebec and the federal government have clearly stated that they wish to reach an agreement. In addition, some provincial premiers have indicated their support for such an initiative. Such demonstrations of good will, while they do not reduce the complexity of the problems involved, at least offer hope that in the near future, a decisive step in the right direction may be taken.

Quebec as a Distinct Society

In order to reach a lasting agreement between Quebec and Canada, one which ensures Quebec's place in Confederation and contributes both to the prosperity of the province and to that of the country as a whole, it is essential from the outset to go beyond the traditional clichés about the unique nature of Quebec. In this way, a realistic interpretation will emerge of the facts which apply to Quebec in 1985. However, two specific pitfalls must be avoided. The first mistake would be to seek a cultural homogeneity which embodies Quebec's distinctiveness: if such homogeneity ever existed, it is certainly no longer characteristic of the province. The second error would be to overlook the collective aspect of the Quebec issue and to view it as a straightforward question of individual rights which could be exercised everywhere in Canada. Since the matter concerns living, working and thriving in a mother tongue, the collective dimension is not to be underestimated.

The period between the beginning of the 1950s and the present has witnessed a fundamental transformation of Quebec society; indeed, a comparison of the report of the Quebec Royal Commission on Constitutional Problems (the 1956 Tremblay Report) and its description of Quebec society with the present reality creates the impression of two entirely different worlds. In 1956, the Tremblay Report described a Quebec which was culturally distinct and essentially rural, and which was characterized by its regard for religious values, its opposition to economic materialism, and its fundamental political conservatism, that is, its opposition to the development of the machinery of government. Behind this facade, however, ideas were evolving which had not yet attracted a great deal of attention. Various groups and movements were questioning the traditional concept of authority, debating the secularization of the state, and, most notably, considering new economic, social and cultural trends. The end of the Duplessis era and the advent of the 1960s saw the introduction of a major change in Quebec, which took the rest of Canada by surprise: the old structure was crumbling; the traditional power of the clergy was rapidly becoming a thing of the past; and the state was emerging as an instrument of social and economic reform. Quebecers continued to develop and to refine this new instrument up to the beginning of the 1980s: the education system was overhauled; the social security system was thoroughly reviewed; and a pension regime was introduced. Several provincial Crown corporations were established, notably in the economic sector; and, finally, various measures were adopted which had been designed to open Quebec to external influences. The unprecedented defence and recognition of bureaucratic and political machinery as a significant element in the reinforcement of Quebec nationalism were also to give rise to repeated requests for greater provincial constitutional powers.

At the beginning of the 1980s, however, and after the referendum on Quebec's sovereignty, a new situation developed. In the public sector, on the one hand, escalation of the political debate between Quebec and the federal government was blocked. To the extent that Quebec's independence, hypothetical though it was, was set aside as an objective, the ongoing debate about Quebec came to centre on the province remaining in Confederation. Moreover, the apparatus of provincial government was being perceived in a new light: increasingly cumbersome and costly, it was no longer seen as the sole instrument of development for Quebec society. In these circumstances, the quest for expanded constitutional powers abated to some extent, especially since it was quite difficult to exercise fully powers which had already been recognized. On the other hand, and in tandem with these political changes, a new attitude developed concerning the role of the private sector in the economy. Spurred by the increasing number of francophone entrepreneurs making their mark in the traditionally anglophone business world, Quebecers discovered a new interest in business: the old demon of materialism had been exorcised. Indeed, in 1985, nearly 40 per cent of all students seeking Masters' degrees in Business Administration at Canadian universities are Quebecers.

Throughout this period, moreover, the self-image of Quebecers and the social reality of the province underwent substantial changes. Those who had previously described themselves as "French Canadians" took to defining themselves, with increasing frequency, as "Quebecers". A new nationalism appeared, which was less preoccupied with survival, increasingly forward looking, and fundamentally linked to the territory of Quebec. When the Parti québecois came to power, this new nationalism was hailed as the manifestation of the vitality of a society which had at last discovered its identity. Paradoxically, however, the more the provincial government sought the support of a majority of all Quebecers, the clearer it became that ethnic origin could not be the corner-stone of the new nationalism. Indeed, Quebec culture, deeply influenced by common historical experience, has been losing its homogeneity little by little as increasing numbers of immigrants settle in the province. Moreover, it has been evolving along with Quebec political life, to which it is indissolubly linked. Thus, during the 1960s and 1970s, Quebec culture was oriented around the assertion of a new collective identity. With the arrival of the 1980s, not only has the province's culture become more open and pluralistic but, in the opinion of some observers, its very existence is threatened by the overwhelming influence of American culture. In fact, Quebec's culture has evolved and adapted. Formerly, Quebec defined itself in terms of its opposition to English Canadian culture; increasingly linked to language rather than to ethnic origin, however, the province now seeks a new identity in the North American and international settings.

Another significant change occurred when the position of Quebec's anglophone minority was eroded within a 20-year period by the Quebec government's increased involvement in the linguistic sphere. Quebec anglophones – economically powerful, politically influential and solidly entrenched on the basis of a network of well-developed institutions largely under their control – had traditionally identified themselves as part of the Canadian majority. However, they gradually came to recognize their minority status within the province of Quebec. Moreover, the exodus from Quebec of a considerable number of anglophones, because of the combined effects of Bill 101 and the economic recession, contributed to the further weakening of the position of this minority. Such a trend was not, in fact, new: Quebec's anglophone population, standing, in 1981, at approximately 11 to 12.5 per cent of its total residents, has been constantly decreasing for a hundred years. At the turn of the century, for example, the population of Quebec City, the Eastern Townships and certain rural districts had included substantial anglophone minorities; but the numbers of these minorities have decreased over the years. What is new is the acceleration of this trend: between 1971 and 1981, there was a decrease of 10 per cent in the anglophone population of the province, which is now largely concentrated in the city of Montreal.

At the beginning of the 1980s, the anglophone minority sensed that its survival in Quebec was threatened in much the same way that francophones had perceived that their survival was threatened 20 years before. Quite soon, however, a new consciousness of its affiliation to Quebec appeared. On the anglophone minority's conviction that it had contributed to the province's development in the past was superimposed the awareness of a new role to be played and of added responsibilities to be assumed. Increasingly bilingual and influenced by organizations such as Alliance Quebec, the anglophone minority defined its new identity in Quebec, thus contributing to the transformation of Quebec society as a whole. A new image of Montreal gradually emerged: that of a city with a majority francophone population, but also a multi-ethnic and bilingual city, rich in its diversity, vigorous in its culture and economy, and open to the world.

Nevertheless, some problems remain unsolved. Bill 101 in particular, to the extent that it projects the image of a unilingual Quebec, is the object of repeated attacks by the anglophone minority. The members of this group will not accept second-class status. Under the terms of the Constitution Act, 1867, the province is officially bilingual with respect to its legislative and judicial institutions. That stipulation does not make either Quebec's refusal to recognize English as an official language in the province or the restrictions imposed on the use of English in the sphere of communications more acceptable to the anglophone minority. The very severity of some of their attacks on Bill 101 is worrying and, unfortunately, is sometimes perceived as an indication that what is sought is a return to the situation which existed prior to 1960. In the changing Quebec of the 1980s, reciprocal trust has perhaps begun to emerge between the francophone majority and the anglophone minority, but it must become more firmly established.

In view of all these changes, Canadians may well wonder what is left of Quebec's uniqueness. To answer this question, we must return to basics. At the outset, Quebec's chief characteristic is the presence within its boundaries of a majority francophone population which controls and determines the orientation of its political and social institutions. The fact of the majority status of francophones in Quebec as compared to their minority status outside that province is fundamental. As the editor of *Le Devoir* wrote recently, "If it is true that the Canadian duality transcends geographic boundaries, it is equally true that it would lose all its meaning if Quebec were to disappear tomorrow."[1] Behind this observation, however, lies a still more basic reality which defines the very essence of Quebec society. As the principal, though not the exclusive, centre of politically structured French life in Canada, Quebec society remains fundamentally and linguistically isolated, an island of French life in the anglophone mainstream. Once outside Quebec, living and working in French and, in more general terms, flourishing in French, becomes difficult, except in some parts of New Brunswick and Ontario which border Quebec. This difficulty continues, despite the significant progress in the provision of bilingual education and public service realized during recent years. A Statistics Canada study based on final census data for 1981 has recently confirmed some researchers' conclusions that the French language is losing ground everywhere in Canada with the exception of Quebec.[2]

Because of its isolation, Quebec is unavoidably committed to never-ending negotiations and accommodations with its external environment. For nearly two centuries, Quebec dealt with the world around it by turning inward and rejecting external values. More recently, following the Quiet Revolution, a new basis for accommodation was set out in the sovereignty-association proposal of the Parti québécois. Considered too radical by a majority of citizens, this proposal was rejected in favour of a kind of renewed federalism with the rest of Canada. This development, however, has not materialized. As a result, Quebec remains constitutionally isolated, in the sense that the provincial government has not yet accepted the 1982 constitutional accord. It is encouraging that the recent *rapprochement* between Quebec and the federal government indicates a mutual desire to end this isolation.

The arrangement which is likely to be worked out will be especially important from a symbolic point of view. As a response to Quebecers' clear expression of their wish to associate with the rest of Canada, as indicated in the 1980 referendum, the new compromise will be all the more meaningful if constitutional recognition is given to the counterpoint of Quebec's uniqueness and its right to retain its differences. Above and beyond this recognition of the distinctive nature of Quebec society, it is the existence of the whole francophone community, in other words, of Canada's basic duality, which is at stake. Notwithstanding such recognition, the fundamental linguistic isolation of this community will endure. The essential question for Quebec and for francophones outside Quebec will remain unchanged: How can the French element of our populations retain its identity in North America? If a satisfactory answer is to be worked out, some important problems will have to be resolved in practice. If, for example, Quebec's economy does not provide the opportunities for employment which francophones need in order to thrive in their language, if the francophone intellectual contribution finds no outlet outside of Quebec, and if the efforts of Quebec to develop economic and cultural links with the outside world are discouraged, then Quebec society, confined as it is, will be in danger of stagnation. The recognition of Quebec's unique character and of Canada's dualistic nature, however, constitutes an affirmation that with the support of the rest of Canada, solutions to these problems can be found. Above all, both Quebecers and francophones outside of Quebec must themselves, individually and collectively, find these answers in the economic and cultural spheres. The new element will be that this search for answers will take place in a context of recognition and affirmation of the cultural complementarity which is, after all, at the heart of the Canadian experience.

There is, therefore, an unforeseen opportunity to conclude a new agreement between Quebec and the rest of Canada. At the outset, what is required in principle is a statement in the preamble of the Constitution which might be worded along the following lines:

> *Recognizing the distinctive character of Quebec society as the principal though not the exclusive centre for Canadian francophones and accepting as fundamental the duality of the Canadian federation . . .*

At the time of the 1980 constitutional negotiations, participants in intensive discussions on this subject came close to reaching consensus. Commissioners believe that in 1985, on the basis of a text such as the one we have just suggested, such an agreement could be reached quickly enough.

Thereafter, the problems arising from Quebec's distinctive character could be considered. Precisely because they are specific to Quebec and interest the rest of Canada only indirectly, their solution would not, for the most part, necessitate constitutional changes. Some problems could be adequately dealt with through intergovernmental agreements, others through delegation of power. The compilation of a complete list would be impossible, as new problems continue to arise. However, one issue which Canadians must address without delay and in some detail is that of fundamental guarantees, since it relates directly to the constitutional agreement of 1982.

Fundamental Guarantees

When the Constitution Act, 1982 came into force, Quebec once again found itself in the position of saying no to the rest of Canada. This resistance, however, unlike Quebec's earlier opposition to the Fulton-Favreau formula and to the Victoria Charter, did not result in an escalation of the debate with the rest of Canada, for the ultimate threat, that of independence, had been dissipated two years earlier. From that time on, the issue of the recovery of the right of veto in Quebec, or rather of the concession of a right of veto (for the right which the province believed it had was denied by the Supreme Court several months later), became an essential condition for the resumption of the dialogue. For a minority group within the Canadian collectivity – as Quebecers were frequently told they were – the possibility of saying no and of exercising a veto inevitably assumes fundamental significance in the face of the firm will of the majority. It should not be surprising that this issue recurs. Deeply rooted in Quebec's political culture, the veto right effectively provides the guarantee that basic foundations will not be undermined.

Clearly, however, to revive discussion of the right of veto is not an easy matter. At the end of 1982 and the beginning of 1983, the possibility of guaranteeing a right of veto for Quebec had been considered, but it had to be set aside when some provinces expressed reservations about the resumption of negotiations on this subject. No doubt it was still too early to initiate such a discussion. With the perspective of several years, however, and with the benefit of a clearer appreciation of the necessity for resolving the issue of Quebec's adherence to the Constitution Act, 1982, to disentangle the elements of viable solutions certainly no longer appears to be an impossible undertaking.

The ultimate goal would be to act so that in the future, Quebec would not have a constitutional amendment imposed upon it which would, in its view, affect its essential interests as a distinct society. To accomplish this objective, two approaches are possible. The first is that of the right of veto as such, which permits a province to block the general adoption of a constitutional amendment. The second is the right to opt out, which does not preclude the adoption of an amendment; rather, it shelters those provinces which exercise the right to opt out from the effects of that amendment. It is widely believed, however, that in order for the opting out provision to be perceived as the equivalent of the right of veto, the former provision must entail full compensation for supplementary costs incurred. Such costs will differ according to circumstances and will often prove difficult to estimate. It cannot be claimed, for example, that a province which refuses to relinquish an element of its jurisdiction will assume new costs directly; rather, the penalty will result from the fact that citizens in the province will eventually find that they are being taxed for federal services which are not being provided there. On the other hand, where a straightforward regulatory power is relinquished, these costs may be insignificant as, for example, in the hypothetical case where an amendment grants the federal Parliament the exclusive right to incorporate companies or to establish safety standards applicable to consumer goods. The current amending formula recognizes the right to opt out with compensation when provincial legislative responsibilities in the fields of "education and other cultural matters" are transferred to Parliament. In effect, Quebec has the equivalent of a veto in these spheres. It remains to be seen whether the same formula can be extended to other jurisdictional sectors which devolve on the provinces from the Constitution. To respond adequately to this question, however, we must first consider the advantages and disadvantages of adopting such a course.

The main advantage of a general right of opting out with full compensation is found in the formula's marked flexibility. Those provinces which favour a constitutional amendment, provided that there are enough of them, can achieve their goal without interference from those which disagree. The latter group can express its opposition without being penalized for doing so. Moreover, the formula respects the principle of the equality of provinces, each of which has the right to opt out. However, it also has disadvantages which are far from insignificant. In particular, it entails the very real risk of a proliferation of special status arrangements. This danger is inherent even in the current formula, which provides the right to opt out without compensation; extension of that formula to include an entitlement to generalized compensation obviously entails a greater risk. Having said this, we should not overestimate the risk. Constitutional amendments requiring a transfer of jurisdiction from provincial legislatures to Parliament are still quite rare, and, in the last resort, the federal government is always entitled to delay presentation of an amendment until it is certain of the support of the majority of provinces. Another difficulty arising from this formula is that it requires negotiation on the extent of compensation; in the case of disagreement, we might assume that for the time being, the federal government's offer would prevail unless the matter is eventually appealed to the courts. In other respects, it is possible that the exercise of the right to opt out would, in certain circumstances, have practically the same effect as a right of veto. This would apply especially where the objective was to find a uniform solution for the whole of Canada. Finally, it should be stressed that the formula of opting-out with full compensation would not apply to amendments affecting national institutions; the Constitution Act, 1982 explicitly precludes the right of opting out in such instances. Bearing in mind these factors, it may now be interesting to consider whether a right of veto as such meets Quebec's need for protection in a more satisfactory manner.

Like the possibility of opting-out, that of the right of veto presents both advantages and disadvantages. Since the right of veto leads directly to the rejection of a proposed amendment, it can in no sense result in a proliferation of special status. Moreover, if this right of veto were granted on a broader basis, as in the Victoria Charter formula, no exclusive advantage would accrue to Quebec. The Victoria formula required the agreement, not only of a majority of provinces, but also that of each province which had ever had a population constituting 25 per cent of the country's total population, a provision which applied to Quebec. This formula also required the assent of two of the Atlantic provinces and of two of the Western provinces, provided that the combined populations of the latter totalled at least 50 per cent of the entire population of the four Western provinces. On the negative side, the right of veto allows one or several provinces, depending on the formula used, to obstruct the course favoured by the majority. If this right is granted to Quebec, it might be perceived as placing an unwarranted restraint on constitutional change, in light of Quebec's traditional stance. Finally, the right of veto, even granted on a regional basis in accordance with the Victoria formula, would create an imbalance between those provinces which can exercise it individually and those which can only do so by aligning themselves with others. The only solution to this problem would be to grant the right of veto to each one of the provinces, thereby risking a constitutional impasse.

Could the provision of a right of veto to the Province of Quebec alone be acceptable in certain circumstances? An interesting hypothesis, recently put forward,[3] would modify the current amending procedure so that when changes to national institutions or transfers of provincial legislative powers were proposed, but no compensation was offered, Quebecers would retain a collective right of veto, to be exercised by means of a referendum. In recognition of the importance of such a decision, a designated special majority might be required. The responsibility for deciding whether such public consultation was necessary would rest with the Government of Quebec, whose task it would be to choose between the opting-out formula, where applicable, and the right of veto subject to confirmation by referendum. This concept has the fundamental advantage of substantially retaining the present amending formula while still protecting the essential interests of Quebec. The referendum would also introduce an element of participatory democracy, which tends to make the use of a right of veto more acceptable. A variant of this formula might delegate to the Quebec National Assembly the responsibility for deciding whether or not to invoke the right of veto, provided that such a decision was supported by a majority of two-thirds or three-quarters of the members.

Another proposal, which was put forward by the Government of Ontario several years ago, would require, as a prerequisite for any constitutional amendment, the approval of two-thirds of the provinces, representing 85 per cent of Canada's population. In effect, such a formula would give Quebec a right of veto, since that province's population is scarcely likely to decline to less than 15 per cent of the total population of Canada. This proposal was rejected, however, because it meant, among other things, that the opposition of three of the four Atlantic provinces would not suffice to defeat an amendment.

Still other solutions could be considered. From whatever vantage point Canadians examine the problem, it must be acknowledged that the granting of a minimal guarantee to Quebec entails, in one sense or another, a political cost. If resolution of the situation requires, at all costs, the retention of the principle of provincial equality, there are concurrent risks: special status arrangements could multiply if the right of opting out with full compensation is generalized; or the Canadian Constitution could remain fixed in its present form if all the provinces are given an identical right of veto. Alternatively, to grant the right of veto either on a regional basis, in accordance with the Victoria Charter, or only to the province of Quebec would inevitably undermine the principle of provincial equality, a principle which was hard won by the Western and Atlantic provinces during recent constitutional negotiations.

In these circumstances, which solution should be chosen? For a number of people, the Victoria amending formula is still the one which seems to go furthest towards reconciling the concerned parties' interests, including those of Quebec. It is unfortunate that at present, it seems hardly possible to return to the Victoria formula, given the unequivocal opposition of some provinces during the 1981 constitutional negotiations. Moreover, since the effect of the current amending formula will not be clear until after it has been tested, it seems unlikely that a return to the Victoria formula can receive serious consideration prior to the constitutional conference which must, by 1997 at the latest, re-examine the whole issue of constitutional amendment. In the meantime, the simplest way of providing Quebec with the guarantee it requires, without jeopardizing the principle of provincial equality, is to give each province the right to opt out with full compensation in every case. This solution, which had the support of eight of the ten provinces in 1981, still seems to be the most acceptable to all of them. Furthermore, most of the pitfalls inherent in this formula are also found in the current amending formula. Commissioners therefore recommend this second formula as the preferred solution with regard to jurisdictional transfers from the provincial legislatures to Parliament.

Where changes in national institutions are concerned, the opting-out formula is inapplicable by virtue of the Constitution Act, 1982. The only way to afford Quebec protection would be to grant it a right of veto. If we assume, once again, that a return to the Victoria formula is impossible in the short term, the only other possibilities would be to grant a right of veto either to all the provinces or exclusively to Quebec. Clearly, the easiest solution would be to grant a right of veto to all the provinces as now pertains, for example, in the matter of determining the composition of the Supreme Court of Canada. This solution might prove costly, however, since it could immobilize our institutions for a prolonged period. To grant a right of veto to Quebec alone would be more difficult politically, but at the same time, it would conform more closely to the desired objective insofar as we acknowledge and seek to protect the distinctive character of Quebec society. From this perspective, every constitutional change which reduces the constitutional guarantees granted to Quebec and related to its special nature could be the object of a right of veto. Thus, if a double-majority formula were introduced in the operation of the Senate for certain defined purposes, Quebec's right of veto would prevent a reduction of this protection without that province's consent. Indeed, the introduction of the double-majority formula in the Senate could itself serve as a right of veto. One possible way to accomplish this would be to change section 47 of the Constitution Act, 1982, to grant the Senate an effective right of veto in cases involving changes covered by the double-majority rule. Whatever solution is chosen, however, Commissioners believe that it is important for Quebec to have protection in the matter of any amendment to institutions described in section 42(1) of the Constitution Act, 1982, insofar as such amendments call into question the special character of Quebec and the duality of Canada.

Both the guarantees relating to the amending process and the recognition in the Constitution's preamble of Quebec's uniqueness should facilitate Quebec's approval of the 1982 constitutional accord. Nevertheless, in order for a lasting agreement to be concluded between Quebec and Ottawa, other issues must be resolved, some relating to national institutions, others to the division of legislative powers. We do not intend to examine every one of these matters here: to do so would be to exceed the mandate of this Commission. It may be useful, however, to consider briefly the means for ensuring that the fundamental interests of Quebec are taken into consideration within federal parliamentary institutions.

We have mentioned the possibility that the Senate might be granted a veto in relation to language matters. Such an idea is not new. In 1978, Bill C-60 and, more recently, the Report of the Special Joint Committee on Senate Reform supported the proposal that any bill with linguistic implications should require the endorsement of a double majority in the Senate, that is, a majority of all Senators and a majority of francophone Senators. Such a measure would positively contribute to reassuring Quebec and francophones outside Quebec that the French language would be protected. In effect, apart from the right of veto granted, the mere fact of having to decide in certain cases whether legislation has linguistic significance would inevitably draw attention to this particular aspect of federal legislation. The new visibility thus accorded to the linguistic dimension of federal interventions would provide a supplementary means of protection for Quebec and for all francophones in the rest of Canada. As was pointed out in the Report of the Special Joint Committee, such a double-majority formula could not be adopted without creating certain problems, particularly with regard to the development of conflict-resolution procedures, the identification of francophone senators, and the criteria to be used for determining which bills should be subject to the double-majority rule. The advantages, however, seem clearly to outweigh the disadvantages. Commissioners are therefore prepared to recommend the adoption of a proposal that "legislation of linguistic significance", or, more precisely, every legislative Act concerning the French language and related cultural questions, should require the ratification of a double majority in the Senate.

As far as the House of Commons is concerned, Quebec's relatively large population has always assured it a significant influence in this elected Chamber. However, the birth rate in Quebec has now declined to such an alarming extent that there is talk of a day when the province might no longer represent 20 per cent of the population of Canada. It is only a single step from that point to considering a provision which would guarantee Quebec a given proportion of seats in the Commons. Such a step, however, must not be taken too hastily. In effect, such forecasts are long-term ones, and many circumstances can change in the short term. On the other hand, the remaining Canadian provinces, with the exception of Prince Edward Island, the smallest one, have always accepted the consequences of representation proportional to the size of their population, and it is unlikely that they would now agree to exempt Quebec from the principle. If the position of Quebec were to become truly critical in the future, there would always be an opportunity to reconsider the matter. For the moment, the protection accorded by the double-majority rule in the Senate, as suggested above, seems adequate, since it would operate regardless of the actual number of francophones in Canada.

Problems Related to the Division of Powers

The problems related to the division of powers, on the other hand, raise more immediate problems, which will require for their resolution not only considerable imagination but also a real willingess to compromise. The experience of the last 15 years has tended to show that where real compromise is sought in an essentially functional perspective, as with Family Allowances and immigration, solutions can be found: agreements may be defined in bilateral accords or in some form of delegation, two methods of co-operation be formally recognized which this Commission has recommended earlier for inclusion in the Constitution. Alternatively, agreements may be defined by the more complex process of constitutional amendment. In either event, the long-term results will more often than not reflect both parties' desire for co-operation. This does not mean, of course, that points of disagreement will not arise. The several problems cited below, insofar as can be determined, are of interest to other provinces as well as to Quebec. There is no doubt, however, that they are matters of special importance to Quebec.

Quebec will always regard certain sectors, such as education, as highly sensitive. Thus, with regard to the question of minority-language education, the Government of Quebec continues to believe that the coming into force of the Charter deprived it of an important part of its jurisdiction. Before Quebec endorses the Constitution Act, 1982, it may seek certain changes in section 23. Access to English-language education for the brothers and sisters of a child who has received part of his or her education in English in another province is stipulated in section 23(2). It seems to be feared that this arrangement could quite easily be used with the sole aim of side-stepping the linguistic regulations imposed by the province in the field of education. However, the Supreme Court has already ruled that the Quebec clause decreed by Bill 101 is unconstitutional with respect to section 23(1)(*b*) and section 23(2) of the Charter. It will undoubtedly prove difficult now to reopen discussion of the Canada clause, the more so because, as even the Government of Quebec admits, this clause does not threaten the linguistic balance in the province. Furthermore, under section 41 of the Charter and subject to section 43, which concerns amendment of provisions relating to some, but not all provinces, any amendment to the Constitution of Canada pertaining to the use of the English or the French language requires the unanimous consent of the provinces. One possible way to re-open the debate might be to broaden the issue so as to include the discussion of section 23(1)(*a*), which accords the right to minority-language education to Canadian citizens "whose first language learned and still understood is that of the English or French linguistic minority population of the province in which they reside." This section remains to be ratified by Quebec under the procedure of section 59. Whatever the approach used, however, it will be difficult to negotiate a satisfactory arrangement without at some point involving the linguistic minorities themselves.

If we proceed beyond this question to consider a much more far-reaching problem, such as the establishment of "national standards" in education, we can readily imagine Quebec's reaction: such a project will be viewed *a priori* as a serious attack on its exclusive jurisdiction. This attitude, we must recognize, is not new. During the 1950s, Premier Duplessis refused to accept federal government subsidies for the province's universities. More recently, in 1984, the universities of Quebec took a similar stand concerning some subsidies provided by the federal government for the development of centres of excellence. In co-operation with the Government of Quebec, these institutions had submitted a list of proposals with an assigned order of priority. The federal government changed this order of priority. Because this change was considered an act of unwarranted interference, the universities agreed to accept the funding offered, but announced that they would place it in trust until an agreement was reached between Quebec and the federal government. The change of government in the autumn of 1984 resolved this problem, for the new federal government accepted the Quebec universities' original order of priority in its entirety. Canadians should not conclude from this disagreement, however, that Quebec is opposed to any co-operation with the federal government and the other provinces in the search for national standards in education. Nevertheless, education is clearly a field where Quebec believes that it has very special interests to protect, and where it will agree to consider itself bound only by formulae which do not threaten what it views as its own ultimate responsibility. Bearing in mind the serious concerns about the quality of education in Canada which many Canadians have expressed to this Commission, it seems highly desirable to seek without delay means of reaching agreement between Quebec and the federal government. In this manner, the excellence sought by all concerned Canadians may be achieved.

Similarly, it is foreseeable that in such fields as international affairs and communications, Quebec will continue to assert its traditional views in order to gain more room to manœuvre. Isolated on a predominantly anglophone continent, Quebec has no choice but to seek contact with the outside world and, in particular, with the international francophone community. However, efforts made in that direction during the last two decades have provoked some adverse reactions in the federal government: Quebec's aims have not always been considered compatible with federal responsibility in the field of external affairs. At present, a certain *modus vivendi* seems to have been reached. Sooner or later, however, the real question will have to be considered, that is, the issue of Quebec's role in this field in relation to that of the rest of Canada. Similarly, there is the matter of Quebec's role in communications, an especially critical field for the future of Quebec's culture. Major developments that have taken place in the last 15 years in the communications field, such as cable television, computer technology and video films, afford a glimpse of the increasingly important penetration into Quebec of the English language. Determined efforts must be made, in close co-operation with other francophone countries, to halt this process by further encouraging both the development of original French material and the translation into French of material in other languages. Otherwise, there may be serious consequences for the future of the French language and French culture in Quebec and Canada. In these two areas, working solutions can easily be developed by recourse to the previously mentioned instruments of delegation or intergovernmental agreements.

Finally, in the economic realm, the major problem will be to provide employment for a population whose mobility is restricted because of language. The unrestricted movement of people which is now guaranteed by the Constitution may be a reality in the rest of Canada, but it remains theoretical where francophone Quebecers are concerned. Between 1976 and 1981, whether because they did not speak English or because they wished to avoid assimilation, fewer than 1 per cent of francophone Quebecers left the province temporarily or permanently to settle elsewhere in Canada.[4]

To recognize the problem is one thing; to find a solution is another. In the wake of *The Report of the Commission of Inquiry on the Position of the French Language and on Language Rights in Quebec* (the Gendron Report) and in direct application of the principles set out in the white paper entitled *La politique de la langue française*, published several years ago, the Government of Quebec launched an extensive campaign designed to enhance the position of French as the language of work. While it is undeniable that the status of the French language and of francophones in Quebec has improved considerably in recent years, it has not been conclusively shown that the recent language legislation is the principal source of such improvement. Nevertheless, it is certain that these measures have had an effect,[5] most notably in the form of initiatives taken by the business community whether indirectly, in anticipation of legislative changes, or directly, in response to the introduction of language legislation. However, other factors, too, have played a part. These include the growth of francophone-controlled businesses and the development of the private sector within the province. A complete picture should also reflect the loss of jobs resulting from the movement of head offices, a shift caused by the implementation of these provincial language policies, even though, in some instances, the real reasons for these relocations may have been quite different. Whatever the degree of effectiveness of these policies, it is doubtful that they could be entirely abandoned in the immediate future. In some respects, they can be viewed as affirmative-action programs designed to improve employment opportunities for Quebec's francophones. In the long run, however, the economic prospects of Quebec's francophones will depend much more on the vitality of Quebec's private sector. The new entrepreneurship which has developed in Quebec in recent years provides good reason to be hopeful on this point. Because of its outward-looking perspective, this new entrepreneurship could contribute not only to the development of Quebec's economy, but also to its greater involvement both in the Canadian economy and in the North American economy as a whole.

Francophone Communities outside Quebec

The problem becomes much more complex when we turn to the situation of francophone communities outside Quebec. Admittedly, the Canadian Charter of Rights and Freedoms has afforded these communities certain individual guarantees in the fields of education and government services. It must be acknowledged, however, that the ability to flourish as communities remains inextricably linked to the development, in various provinces, of active and diversified institutions which contribute to the establishment and meet the underlying needs of a genuine francophone milieu for francophones. In this regard, the situation varies dramatically from one province to another. In New Brunswick, which is well equipped from this point of view, francophone communities enjoy a relatively favourable position with a very low assimilation rate. The farther one goes from Quebec, however, the more difficulty public and private institutions experience in consolidating scattered communities which offer progressively fewer opportunities to work in French. The latest report of the Commissioner of Official Languages and a recent study by Statistics Canada agree that the assimilation rate is so high in some provinces that the affected francophone communities are in danger of disappearing completely in the foreseeable future. Indeed, the situation can, in certain respects, be considered critical.

Can this trend be arrested? Or must we Canadians resign ourselves to the sight of francophone communities outside Quebec disappearing one after another? Such a result would document the defeat not only of a government policy, but also of a vision of Canada shared by a great many citizens: that of a country in which linguistic and cultural communities are valued to such a degree that they are accorded constitutional protection. Clearly, prompt action is required.

For a start, it is essential to reaffirm Canada's commitment to the principle of linguistic duality. In order to do so, it is necessary, on the one hand, to recognize the dual nature of Canada in the preamble of the Constitution as suggested above and, on the other hand, to promote the acceptance of French and English as official languages in the greatest possible number of provinces. In this regard, there is no doubt that if Ontario should decide to make such a move, the effects would be felt not only in that province, but throughout the rest of Canada, and that these effects would increase support for the principle of linguistic duality. Commissioners cannot stress sufficiently the importance we attach to the extension of the principle of bilingualism in Ontario, which has the largest francophone minority. If it is unrealistic in other respects to believe that all the provinces will someday demonstrate the level of commitment assumed constitutionally by Quebec and New Brunswick, it is certainly not unreasonable to hope that, given conditions appropriate to each of them, basic guarantees will be offered to their linguistic minority.

Beyond the principles and symbols, however, lies the reality. Whereas very real progress has been made in the last 15 years in affirming the bilingual character of Canada, these results nonetheless vary greatly, depending on the sector or region involved. In general, they clearly fall somewhat short of true equality. Another part of this Report, which deals with equality, provides an analysis of the situation of bilingualism in Canada. Generally speaking, however, it suffices to consult the reports of the Commissioner of Official Languages to determine how difficult and delicate a process the implementation of bilingualism in the federal public administration has proved to be. Similarly, at the provincial level, recent problems encountered in Manitoba and New Brunswick attest to the complexity of any strategy designed to make linguistic equality a reality in Canada.

Must we then conclude that the introduction of official bilingualism in Canada proceeded too quickly, and that there is now a need to mark time in this area? Some Canadians, who object to the considerable costs entailed by such a policy, and who fear the emotional reactions to which it gives rise, would favour such delay. In our view, however, such a solution would call into question the gains already made. On the contrary, the need is to seek to do more for bilingualism and, especially, in a more effective way.

A first means by which this end may be accomplished is the judicial one. Under section 133 of the Constitution Act, 1867, section 23 of the Manitoba Act of 1870, or sections 16 to 23 of the Canadian Charter of Rights and Freedoms, individuals could go to the courts to seek a judgement upholding their fundamental linguistic rights. In fact, during the past ten years, several such judgements have reminded the various governments concerned of their duties in the matter of linguistic rights. But this solution requires a long and arduous journey, and, unfortunately, one that sometimes fails to achieve results. Moreover, in the Ontario Reference Case, based on section 23 of the Canadian Charter of Rights and Freedoms, the Ontario Court of Appeal held that the judicial authority is not the only custodian of Canadians' constitutional rights, and that Parliament and the legislatures also have responsibilities in the field of linguistic rights. The court added: "Minority linguistic rights should be established by general legislation assuring equal and just treatment to all, rather than by litigation."[6]

In view of this comment, we Commissioners believe that above all, it is up to Parliament and the federal government to set the example if only because of the experience they have gained in the application of the Official Languages Act. More specifically, the Commissioner of Official Languages should be encouraged to pursue vigorously the job of educating the public, as well as overseeing the implementation of the pertinent acts and regulations. In this connection, the recommendations put forward by the Special Joint Committee on Official Languages should be seen as evidence of the need to upgrade the Commissioner's position in terms of both mandate and resources. These various recommendations should, insofar as possible, receive government support.

The fact remains that despite all these efforts, the scattered nature and small populations of francophone communities outside Quebec make the survival of some of them as French-language environments very problematic. *La Fédération des francophones hors Québec*, especially sensitive to this aspect of the problem, published a report several years ago, entitled *Une espace économique à inventer*, in which it presented recommendations designed to strengthen the economic underpinnings of francophone communities outside Quebec. Shortly afterwards, in 1982, the Federation organized a national symposium on the economy. More recently still, another conference on the subject "From Linguistic Protection to Economic Development" was held at the University of Moncton. What emerged from the Federation's report, as well as from the symposia, was a clear sense of the importance of establishing an economic "space" where it will be possible for Canadian francophones outside Quebec to live, work and develop their culture in French.

This orientation bears out the conclusions of some research undertaken on this Commission's behalf, which found that the survival of Canadian francophone communities outside Quebec depends on establishing centres of activity structured around public and private francophone institutions. Here again, it would be unrealistic to believe that all francophone communities outside Quebec could develop such centres of activity by using a single model. For some provinces, such centres would have a basically cultural orientation: they would develop to the greatest extent by successfully integrating the largest possible number of Canadians who now have a working knowledge of French and those who have attended French-immersion courses. In other provinces, notably Ontario and New Brunswick, the economic component, which enhances the cultural aspect, will necessarily be more important. Just as in Quebec, however, it is, above all, the individual initiative of francophones themselves which will bring about such a development. Government support, however useful it may be, will never take the place of individual initiative. Commissioners believe that there must be movement in this direction if the long-term survival of francophone communities outside Quebec is to be ensured.

Conclusions

Beyond all the problems to which Commissioners have alluded, and which are in some ways inherent parts of Canada's political development process, we must emphasize our country's inestimable richness embodied in the complementary relationship between its two chief linguistic groups. It is now time to turn the page which records the past history of Quebec's relations with the rest of Canada and to begin another to record the new era of co-operation. With the recognition of the duality of Canadian society and the distinctive character of Quebec society, it seems inevitable that problems will continue to arise in the future, but it also seems likely that these problems will be solved as a by-product of the search for the parties' common interest.

The Northern Territories

While this Commission has looked, in general, at the problems facing Canada from a national rather than a regional perspective, the situation of Canada's Northern territories merits special attention because it is unique within the federation and within the Canadian economic union, and because most Canadians lack a full appreciation of the challenges facing Northerners. The North is of inestimable significance to the future of the Canadian economy. Although the high cost of developing non-renewable resources will probably prevent dramatic growth over the medium term, the vast northern territories have untapped resources that will help to supply Canada's industrial raw materials and energy fuels long into the next century. They are also the homeland of Canadians of many origins and of a rich blend of cultural characteristics. The interests and aspirations of Northerners must be accommodated within any strategy for the development of Canada's economic wealth.

In some ways, the success with which political leaders integrate competing national and regional interests in the Northwest Territories (NWT) and Yukon will be one of the most important tests of our Canadian federation over the next two decades. The fundamental issues of collective rights versus individual rights and of national unity versus regional diversity are crystalized in the North today. The mistakes made elsewhere in the federation over many years can be avoided in the North because there the slate is almost clean. The opportunity remains to find solutions to many of the dilemmas that plague the politics of southern Canada and to make the northern jurisdictions a symbolic demonstration of the kinds of creative solutions possible within the context of Canada's institutional framework.

Before commenting on and making recommendations about the special issues and problems of the Northwest Territories and Yukon, Commissioners wish to review some general background about the North: its people, its economy, its politics and its special constitutional relationship to the rest of Canada.[1]

Background: Society, Economy and Culture

Northern Society

As we Commissioners learned from our hearings and discussions in several northern communities, to understand Northern issues requires an appreciation of the internal diversity of the North. The Northwest Territories and Yukon are dissimilar in many respects, and even within the Northwest Territories there are significant differences among the Mackenzie Valley, the Mackenzie Delta-Beaufort Sea, Kitikmeot, Keewatin, Baffin and high Arctic regions. Hence, while this Commission will make some generalizations, it recognizes the North as a vast and diverse area.

About 47 000 Canadians live in the Northwest Territories and approximately 23 000 in Yukon: a mere 70 000 souls scattered across an area comprising approximately 40 per cent of Canada's land mass. Not only is our

Northern population small, it is also extremely diverse culturally and linguistically. In the Northwest Territories, the Inuit comprise 35 per cent of the population; they live in the north and east, beyond the tree line. They share a common language, with several regional dialects, and have retained close cultural ties with the Inuit of Alaska and Greenland. The Indians of the Mackenzie Valley and the Great Slave Lake region, the Dene, comprise 17 per cent of the territory's population and speak several languages, all of which share the Athapaskan root. Most of the Métis live in the same regions as the Dene, sharing the same communities and lands. The Métis make up an estimated 6 per cent of our Northern population. The remaining 42 per cent are non-Natives, often temporary residents or transients who work for government departments, in schools or on resource-development projects. In the Great Slave-Mackenzie Valley region, growing numbers of non-Natives are permanent residents who view the Northwest Territories as their home.

In Yukon, the Indian people comprise approximately one-quarter of the total population. Most speak Athapaskan dialects; a few, in the south-west, speak a dialect of Tlingit-Haida. There are no Inuit in Yukon, and most non-status Indians identify with the status Indians and are counted as "Natives" in territorial statistics. Some non-Natives in Yukon are transients and temporary residents, but most are long-term or permanent Yukoners, many with family connections in the territory going back several generations. The long-term residence of non-Native Yukoners and the minority status of the Native population has produced conflict, but both sides desire a mutually acceptable accommodation of Native and non-Native interests, recognizing that political development of the territory depends on that compromise.

The Northern Economy

To understand the economy of the North, we must look at the Northwest Territories and Yukon in relation to the economies of Canada and the world, and examine them in terms of economic relations within the two territories. The Northern economy is based on the production of staples, and the most significant of these are non-renewable resources. The North exports these staples to the South in raw or relatively unprocessed form. Because the export price of non-renewable resources depends largely on world prices in markets over which our Northern economy has no control, the North suffers from virtually complete economic dependence, from economic instability, and from "boom-bust" cycles. Thus, while the future wealth of the North probably lies in developing its non-renewable resources, that sector is extremely volatile. For this reason, it may prove too fragile and too unstable to support long-term employment.

The large scale of most Northern development projects and their extraordinarily high production costs require the use of development capital from non-Northern sources. Accordingly, governments and multi-national corporations dominate the financing of most such projects. Moreover, while the North possesses a strong, if not stable, primary sector and a large and comparatively stable service sector (chiefly owing to governments' activities), secondary manufacturing is virtually non-existent. Transportation, production and labour costs inhibit growth in labour-intensive manufacturing and make it, too, an unlikely source of long-term employment. (See Table 24-1.)

TABLE 24-1 Distribution of Labour Force by Industry, 1981

Industry	Yukon	NWT	Canada
Agriculture	0.64	0.13	3.92
Forestry	0.53	0.38	0.82
Fishing/Trapping	0.30	1.19	0.30
Mining (including oil and gas)	10.00	10.88	1.71
Manufacturing	2.26	2.08	18.09
Construction	6.88	4.98	6.13
TCU[a]	11.99	10.60	7.63
Trade	12.82	10.65	15.96
FIRE[b]	3.76	3.51	5.06
CBPS[c]	23.31	24.02	27.71
Public Administration	19.21	25.29	7.23
Undefined/N.A.	8.42	6.28	5.44

The Northwest Territories and Yukon have three distinct economies. Only Native peoples participate in the traditional or subsistence economy. The pure subsistence economy, while based on staple production, does not depend on export of the product. Very few Natives are involved exclusively in the subsistence economy; most supplement their hunting and fishing activities with frequent, if temporary, forays into the wage economy. Generally speaking, the traditional economy is healthier in remote communities than in larger and more accessible centres, and many Inuit, because they live in remote areas, continue to subsist mainly on "country food".

The North's second economy is an extension of Canada's Southern wage economy. Many Northern non-Natives participate in this economy, and growing numbers of Natives, too, work for governments in resource-development projects, and in other enterprises in the private sector. Natives are not more fully involved in the wage economy of the North because of their lower skill levels, their place of residence, their unwillingness to relocate, and the importation of Southern non-Native workers. The most important reason, however, is that the wage economy undermines the traditional Native economy. Regular employment in the wage economy allows no time for hunting, and many Native people are unwilling to give up that way of life to earn a stable income.

In addition, the North has a social-assistance or "welfare" economy. Most of the beneficiaries are Native, though few exist entirely on this income. They use the money primarily to buy food staples, rifles, ammunition, snowmobiles, outboard motors, and other equipment and supplies, thus buttressing the traditional economy.

The three economies interact, and many Native people occupy a place in each of them from time to time. For instance, seasonal employment clearing brush can be supplemented by trapping, hunting and fishing, and all these sources of income are ultimately supported by social assistance. Thus, while the greatest potential for job creation in the Northwest Territories and Yukon is in the non-renewable/resource sector, any analysis of our Northern economy must recognize and allow for the importance of subsistence hunting and fishing as a complement to the wage economy.

The Political Culture of the North

Political institutions, attitudes and debate in the Northwest Territories and Yukon are all rooted in the liberal democratic values of Southern Canada, but not exclusively so. The traditional values of the Native community interact with the basically liberal values of Northern non-Natives to produce a distinctive political culture. For instance, Natives place a far higher value than non-Natives on the collectivity: the community. This "collectivism" derives from the precarious nature of life in traditional hunting and gathering societies, where the survival of the tribe, the clan, the extended family or the community is more important than the fate of any one individual. Individualism is a luxury that traditional societies often cannot afford.

A corollary of this collectivist concept of society is the absence or weakness of the notion of private property in both the Indian and the Inuit cultures. The concept of individual possession, a cornerstone of liberal societies, is replaced by the principle of community sharing. Thus individuals are not perceived as owning things but, rather, as using them; and, when a particular item is not in use, it automatically reverts to a "common" status where it is free to be used by some other member of the group. Nowhere does this concept appear more clearly than in Native attitudes to the land.

Members of the Indian and Inuit cultures hold the land and its resources in reverence, for the community depends on the land for survival. The Native peoples feel a oneness with the land, for they believe that the people and the land are extensions of the same Being, and the traditional Native religions foster respect for the land and for the plants and animals that share it with humans. Native persons view the world around them as a homeland given to them, to which they must adapt in order to survive. This concept contrasts starkly with the "Southern" notion of the "frontier", which sees the environment as essentially alien and hostile. This view holds that humans must adapt the Northern environment to their own use: they must conquer or domesticate it and make it useful.

The Native concept of the land has led to conflict over development of non-renewable resources in the North. There is a very practical fear that such projects may do irreparable damage to the environment, and so destroy the renewable resources on which the Native economy and the traditional way of life depend. In addition, extraction of non-renewable resources is alien to the

Native culture. The Native economy uses the fruits of the land, extracting only renewable resources and never permanently alienating any of its wealth. Thus, while Natives are gradually coming to accept development of non-renewable resources, they continue to be concerned about the effect on their traditional economy and on their way of life.

Collectivism appears also in decision making by consensus. As a result, the entire community has a right and even an obligation to participate in such decisions. This collectivist concept of society enabled Northern peoples to govern themselves in an orderly and systematic fashion centuries before the arrival of the first European explorers.

Consensual decision making does not eliminate the need for leadership, but, unlike Southerners, the Dene and the Inuit do not see political power as monolithic. Liberal political theory links the concept of political authority to that of sovereignty. Patterns of authority in the modern liberal state are basically unitary and hierarchical. In contrast, Native society is characterized by more diffuse political authority: its communities follow different leaders for different kinds of activities. The form of decision making varies for hunting, spiritual matters, family matters, settlement of internal disputes or punishment of wrongdoers. Consensus determines who is most suited to lead in any given situation. Thus, there is a functional division of labour: the best hunters will dominate in one area, a shaman in another, and the tribal elders in still others. Institutional transplants from the South have ignored these basic political principles, and as a result, many have failed.

Political Economy and Political Culture

The wage economy too, does not mesh easily with Native values, and the incongruity makes it difficult to integrate Native workers into the Northern labour force. Indians or Inuit entering the wage economy must abandon collectivist values and set aside the sense of community so integral and so essential to their way of life, since their work in the wage economy is not for the collective good of the community, but for individual gain. The change of values represented in this experience contributes to aboriginals' alienation from their culture which, in turn, undermines traditional social structures and patterns of authority. Consequently, Native people come to see power and influence in terms of income or monetary wealth, rather than in terms of traditional skills. Elders who remain within the traditional economy may clash with younger people who have chosen non-traditional employment.

The wage economy forces Natives to uproot themselves and their families from their homes in order to find work. This disruption, coupled with the fact that most wage employment is found in relatively urbanized settings, can cause alienation, serious social disorientation, and a loss of the sense of community. While informing young Natives entering the wage economy about its pitfalls can moderate these negative effects, the basic dilemma lies in the incompatibility of the wage economy and traditional Native values.

The wage economy, particularly that tied to the extraction of non-renewable resources, alienates Native people from the land. All aspects of a traditional hunting and gathering society – its social values, political culture, art, legends, religion, social structure – reflect its central purpose of survival through the use of renewable resources. To remove this central purpose and to replace it by either a wage or a welfare economy could destroy the core of Native culture and ultimately threaten its survival.

Northern Native peoples have recently begun to adapt to the development of non-renewable resources. They are balancing traditional priorities with the pressures of mega-projects and Southern encroachments on their communities, and they are setting up corporate mechanisms such as locally-controlled development corporations. These institutions, coupled with the older community-based co-operatives, permit Natives to participate in the wage economy through institutions which they themselves control, and which are therefore sensitive to the traditional economy and way of life. All Canadians hope that such "bridging" methods can be further developed.

The economic and cultural factors outlined above interact with one another and shape political and constitutional issues in the North. Economic development will affect the fate of the Native culture. It is a fragile culture under siege, not because of deliberate attack from non-Natives, but because of rapid development in the North. Thus, economic and cultural changes, as well as pressures from the South, set the agenda for political discourse.

Issues and Recommendations

Long-term economic growth in Northern Canada depends on the exploitation of non-renewable resources. The Northwest Territories and Yukon represent over one-third of Canada's land, and their petroleum and mineral resources have scarcely been touched. For these reasons and because of the continuing, though reduced, importance of resource development to our national economy, the futures of Canada and of the North are inextricably intertwined. However, while development of non-renewable resources may be essential for Northern development, it is not the only important issue in the region.

There are cultural, economic and political issues in the North that clearly distinguish it from the rest of our country. One of the North's most significant distinguishing features is its Native people. The plight of Native Canadians is of concern throughout Canada, but in the North, Native issues actually dominate political discourse. Ultimately, these and other controversial matters with institutional dimensions will affect the nature and pace of development in the region. Canadian decision makers must deal with all these issues quickly and sensitively, not only to ensure development, but also to arrange for the Native and non-Native people of the Northwest Territories and Yukon to enjoy the same rights and benefits as other Canadians.

Native Northerners and Political and Economic Change

Aboriginal Claims

Most Canadians now accept that Native people in the North have a legitimate claim to lands used traditionally in subsistence hunting and fishing, as well as a right to financial compensation for past alienation of their lands and resources. Most support the concept of fair and prompt settlement of the aboriginal claims of Native Northerners, and the federal and territorial governments have committed themselves to negotiating such a settlement with representatives of the four main Native groups. Unfortunately, ten years of negotiations have settled only one of the four major claims, that of the Inuvialuit, the people of the Mackenzie Delta-Beaufort Sea region. Failure to settle the other three claims has retarded economic development, blocked constitutional change, and prevented creation of a separate territory in the Eastern Arctic. It is high time to conclude negotiations, ratify settlements, and proceed with economic and political development of the North for the benefit of all Northerners and of Canadians generally.

Negotiations on aboriginal claims hang on two issues: extinguishment of claims and political rights. The former has produced a stalemate between the governments and Native organizations. Natives have argued that the claims settlement should guarantee aboriginal rights in perpetuity, while the federal and territorial governments argue that statutory and constitutionally entrenched protections should replace traditional aboriginal rights. Since much of the dispute hinges on semantics, abandoning the term "extinguishment" in the deliberations would help to eliminate this obstacle. The settlement should "affirm" the specific aboriginal rights being recognized and acknowledge that the lands and moneys involved are being ceded in perpetuity.

Special political rights for aboriginal peoples have been a prominent issue in recent years in all parts of Canada. There is growing willingness to consider "special status", or "Native self-government" for Native Canadians: institutional arrangements that would allow Native people more control over their cultural affairs, education and social services, and that might even guarantee them representation in national institutions such as the Senate. While the liberal values of individualism and universality have so far dominated our Canadian political culture, we should certainly feel free to seek other means of accommodating the special interests of collectivities in our federal institutions. Land-claims negotiations, however, are an inappropriate forum for developing such mechanisms. Because these mechanisms would affect the rights of both Native and non-Native Canadians, Parliament, the legislatures of the Territories, and constitutional conferences would be ideal settings for discussion. In this Commission's view, Natives should participate on boards and commissions dealing with matters directly affecting their lands and renewable resources, but they should not attempt to use the claims process to entrench either legislative jurisdiction or special representation in legislative bodies pertaining to any order of government.

The federal government might wish to consider negotiating a deadline for settlement of Northern aboriginal land claims, after which funding of Native negotiating teams would cease. The federal government, Commissioners believe, should state unequivocally that legislative powers, sovereignty and special political status will not be part of any claims settlement, but that such settlements will not in any way restrict the power of Native peoples to take advantage of special political rights defined by other forums at some time in the future. While the agreements, in our opinion, should be seen as affirmations of aboriginal rights rather than as extinguishments, they should also be final and binding on Native groups, the territorial governments, and the federal government. Certainly, further delay in reaching final settlements will serve no one well.

The Renewable Resources Sector

While all Northerners have a stake in the future of renewable resources in the two Territories, these resources constitute the economic base for Native people. The renewable resource economy contains commodity production and subsistence. The most important component of the renewable resource sector is the traditional economy of the Native people. The key problems in commodity production revolve around the fur industry. At the best of times, this industry faces severe market fluctuations, and the recent European boycott and the increasingly powerful lobby against leg-hold traps have left it in a state of virtual collapse. This decline has meant significant losses in revenues for Northern Natives and has put additional strain on Northern social services. While the fur trade is no longer a major component of the Canadian economy, it has, until recently, supplemented other sources of income, and it complements the subsistence activities of Native people, particularly in Northern Canada. While it is unlikely that the fur trade will ever again be a major part of the Northern economy, Commissioners suggest that the federal and territorial governments should continue to explore means of countering the anti-trapping lobby, of finding new markets, and of developing alternatives to the fur industry.

One possible alternative to the fur industry is Northern commercial fishing, for the northern seas offer potential for the commercial harvesting of fish and other seafood. This possibility requires further study. In the meantime, the federal government should ensure that regulatory agencies and marketing boards dealing with the fishing industry do not unintentionally retard or block development of a Northern fishery through exclusive concentration on the problems and interests of the Atlantic- and Pacific-coast or inland fisheries.

The subsistence portion of the traditional economy is quite healthy. Subsistence hunting and fishing, particularly in more remote communities, are not disappearing; indeed, they are a significant part of the Northern economy. A tendency among analysts to dismiss the traditional economy stems from the difficulty in measuring it and from the view that hunting and gathering are outmoded activities. In the North, however, approximately 30 per cent of the real income of Northern Natives comes from the harvesting of country food, and that harvest provides a significant percentage of the protein needs of Northerners.

Thus, in the North, the subsistence economy has a place analagous to that of agriculture in the South. Accordingly, the framers of policies and programs aimed at bringing Native people into the wage economy should recognize that like farming, subsistence hunting and fishing are an occupation. The territorial and federal governments should therefore explore the possibility of developing means to upgrade and strengthen the subsistence component of the North's economy by, for instance, allowing tax breaks for full-time hunters comparable to those available to farmers in the South. They should also ensure that training and development do not focus on development of skills marketable only in the non-renewable sector. Such programs should take account of the cyclical participation of Native Northerners in the Northern wage economy and in production of country foods for personal and family consumption. Some funds earmarked for training might usefully be devoted to upgrading traditional skills, as well as to improving employment prospects in the wage economy.

Constitutional and Institutional Development in the Northwest Territories and Yukon

Three basic constitutional issues dominate the political agenda within and about the North. Two of these issues, responsible government and devolution of power from the federal to the territorial level, are of equal concern in both Territories. The third, the division of the Northwest Territories into two separate jurisdictions, is of direct concern only to the people of that Territory.

Commissioners believe that responsible government and continued devolution of federal responsibilities to the territorial government should occur with or without division of the Northwest Territories. Nevertheless, it is unlikely that such constitutional development will take place before the issue of division is settled. Creation of two new territories may require different rates of constitutional development in order to accommodate local priorities and different administrative and employment capacities. In this connection, Commissioners wish to emphasize several points: governments should not let the issue of division of the Northwest Territories frustrate the aspirations of the people of Yukon for full responsible government; our recommendation of responsible government should be taken to apply equally to an undivided Northwest Territories or to the two new territories that might emerge following division; our recommendations concerning devolution of authority to the territorial governments should apply equally to the territories that might emerge after division. In addition, the federal government timetable for devolution should not be imposed on the new territories, and the elected representatives of those territories must participate in setting the priorities for transfer of power. It must be recognized, however, that there is urgency to resolve the issue of division so that constitutional evolution in the Northwest Territories can proceed.

Responsible Government

In Canada responsible government has three main features. The Cabinet, or executive council, can be "the government" only if it has the support of a majority, that is, the "confidence", of the legislature; the Cabinet exercises the powers of the Crown; and the executive is responsible to the legislature for the "public purse", that is, for all matters of supply and "ways and means".

Yukon has achieved *de facto* the first two of these features of responsible government. Its Commissioner acts in a manner analogous to that of a Lieutenant-Governor in a province, and the Legislative Assembly has the power to vote non-confidence in the government. In this Commission's view, the federal government should amend the Yukon Act to reflect this reality.

The Commissioner of the Northwest Territories still exercises some policy-making power in the day-to-day operations of government, and it is not clear whether the Legislative Assembly can vote non-confidence in the Executive Council. The Northwest Territories is the last jurisdiction in Canada without responsible government, and we Commissioners believe that there is no justification for continued denial of this right. The federal government should, in our opinion, grant the Legislative Assembly powers commensurate with those of Yukon's Assembly.

Some Canadians will argue that responsible government cannot exist without a well-developed party system, and that the Northwest Territories, unlike Yukon, lacks political parties at the territorial level. The expectation of executive authority, however, will ultimately motivate the loose and shifting coalitions of non-party governments to transform themselves into disciplined parties. The federal government should therefore amend the Northwest Territories Act to give that area responsible government.

The third requisite for full responsible government is, of course, complete control of the public purse. With the current system of funding, the federal government must still agree on a basic set of spending targets for each of the Territories. If a Territory has had financial troubles, the federal government has usually provided additional support. The territorial governments desire a system of formula financing which would give them both greater fiscal autonomy and corresponding responsibility. Such a system would make federal transfers predictable over long periods and allow for long-range budgetary planning. Hence, the federal and territorial governments should negotiate financial arrangements to give the territorial governments full power over the public purse and to impose genuine responsibility and accountability for expenditure.

Devolution of Authority

Over the past two decades, the Northern Territories have evolved from virtual colonial status to the acquisition of responsibility for a wide range of "provincial" services. The logical end of this process is provincehood, although four barriers might delay progress towards provincial status for a decade or more. These are the Territories' small populations, their uncertain revenue base, their unresolved internal disputes, and the practical considerations of a national interest in the North. Our new constitutional amending formula specifies that creation of a new province requires the consent of at least two-thirds of the existing provinces, representing 50 per cent of our population, and of the federal parliament; to secure agreement might prove a formidable task. Existing provinces might oppose creation of new provinces simply because it would alter the balance of the amending formula. (For instance, if there were 13 provinces, two-thirds (9) of the provinces with more than 50 per cent of Canada's population could amend the Constitution without the approval of any of the four Western provinces.) Nevertheless, though even territorial leaders who aspire to provincehood are not demanding it immediately, the people of the North are making a legitimate request for *de facto* status. Commissioners believe that the federal government should indicate its commitment to some form of provincehood for the Territories as an ultimate goal and should grant Northerners all the benefits of Canadian citizenship.

The North will probably overcome the first three barriers to provincehood mentioned above. Population, now growing largely through increase of the resident population, will expand through migration as economic development proceeds. Similarly, as the Northern economies evolve, the revenue base will expand, and the Territories will develop a more adequate tax base. The internal problems, settlement of land claims and division of the Northwest Territories, will probably be settled within the next few years.

The fourth barrier to provincehood will be the most difficult to surmount. It is represented in the question: Is it appropriate for 70 000 residents of the Northern Territories to assume control over approximately 40 per cent of Canada's land? The question implies its own answer, and that answer leads Commissioners to believe that there should be continuing national interest in the development of Northern Canada. Few, even of the most strident of Northern autonomists, would dispute this conclusion. As one Northerner stated in our hearings, "The North is the future of Canada." Because we accept the validity of that statement, we consider that the future of the North should be the concern of Northerners and of all Canadians. The federal and territorial governments must find a means of sharing responsibility for development. The people of the Territories must have some influence on decisions that affect them and their homeland, and so too must the federal government in its role of representative for all Canadians.

Where there is no demonstrable national interest, territorial governments should have powers like those of the provinces. Thus the federal government, in consultation with the territorial governments, should establish a timetable for the transfer of provincial-type responsibilities in areas such as health, the institution of criminal proceedings, labour relations, inland waters and renewable resources. Joint-management arrangements might prove to be valuable transitional tools. Timetables might vary from territory to territory and from one type of jurisdiction to another, but devolution to the Territories of most aspects of these matters should be completed within five years. Opponents of such a proposal may raise the issue of costs, but the federal government is presently bearing the costs of performing these functions, and the territorial governments could perform them just as efficiently. While there might be marginal additional costs because of negative economies of scale in such small jurisdictions, savings from the dismantling of parts of the Northern program of the Department of Indian Affairs and Northern Development will at least partially offset them.

There is a clear national interest in non-renewable resources and ownership, and control over land for their development. Various approaches could facilitate co-operative federal-territorial sharing of these responsibilities: delegation of powers to the territory, but with a federal veto in matters of an overriding national interest, or concurrent jurisdiction with federal paramountcy. Joint management similar to that of the offshore resources agreement between the federal government and Nova Scotia or Newfoundland is also a possibility. It is important, however, for the federal and territorial governments to devise mechanisms to involve the territorial governments more fully in decisions affecting development of non-renewable resources. Moreover, any such arrangement should define the circumstances where there could be a federal override.

It probably would not be in the national interest to transfer all lands in the Territories to the territorial governments in a single action. However, once the mineral and petroleum potential of territorial lands becomes known, and once such issues as aboriginal land claims and national parks and park reserves have been settled, the federal Crown could begin to transfer large parcels of land to the Territories. Such transfers, if made gradually, would in no way compromise the national interest and would give the territorial governments both increased revenue potential and greater effectiveness in development of renewable resources, tourism, municipal affairs and territorial parks. The governments should begin negotiations to transfer to the Territories the surface rights to Crown lands that do not directly bear on the national interest and that have not been ceded to the Native people through the settlement of claims.

In the short term, at least, ownership and control over non-renewable resources will rest with the federal government. However, the people of the North should enjoy a fair share of the revenues and royalties generated by resource-development projects. The federal government should consider arrangements for sharing resource revenues with the Territories; these arrangements could be similar to those negotiated with Nova Scotia and Newfoundland. The Government of Canada would have to integrate such an arrangement within the formula for federal-territorial financial transfers so that windfalls from non-renewable resources would result in automatic prorated reduction of transfer payments. Moreover, there should be an overall ceiling on revenues accruing to the Territories from non-renewable resources.

Provincial status is normally a prerequisite for full participation in federal-provincial conferences. However, although provincehood is not in the immediate offing for the Territories, Commissioners are of the opinion that the federal government should provide for direct participation of their governments in such deliberations. This involvement is particularly important for discussions of matters directly concerning Northern residents. It does not require a constitutional amendment, and it could occur immediately.

Finally, one important symbolic step for the Territories would be to remove the provision in section 42(1)(*e*) of the Constitution Act, 1982 that allows for extension of existing provinces into the Territories without agreement of the people of the Northwest Territories and/or Yukon. The federal government should initiate an amendment requiring agreement of the legislative assembly of the territory concerned before existing provincial boundaries could be extended north of the sixtieth parallel.

Division of the Northwest Territories

In the period since 1979, the Legislative Assembly, a territorial plebiscite, and Liberal and Conservative federal governments all have supported in principle division of the Northwest Territories and creation of a new territory of Nunavut in the eastern Arctic. Unfortunately this goal still seems distant. Difficult issues remain: location of the boundary and of seats of government, the form of government, and the timing of the division. Of these, the boundary is the most difficult issue to resolve.

Members of the Constitutional Alliance of the Northwest Territories are still discussing the boundary. The Nunavut Constitutional Forum (NCF) has been arguing for a line that runs diagonally, southeast to northwest, roughly following the treeline. The Western Constitutional Forum (WCF) generally favours a north-south boundary from the sixtieth parallel to the Arctic Ocean, west of the community of Baker Lake and east of the Committee for Original Peoples' Entitlement (COPE) communities. The two forums have reached a tentative agreement, but have not yet ratified it.

Two sub-issues delay settlement of the boundary. First is the issue of community: Will the people of the Western Arctic (Inuvialuit) and those of the Central Arctic join Nunavut or the Western Territory? Geography and transportation and communication links suggest that they would choose to join the Western Territory, but cultural and linguistic ties with the Inuit of the eastern Arctic point to the likelihood of their joining Nunavut. Choice of a boundary involves human considerations, particularly the wishes of the people affected. The January 1985 agreement between the NCF and the WCF would have left the Inuvialuit communities in the Western Territory and allowed the Central Arctic communities to make their choice by referendum. However, the NCF withdrew its support for the boundary agreement at the end of February 1985, and the issue remains unsettled.

The second issue derives from the implication of the boundary for access to natural resources. To be economically viable, both Nunavut and the Western Territory must have a sound resource base. The dispute is centred on control of the western Keewatin – the unpopulated lands between Great Slave Lake and Baker Lake, with their potentially rich resources – and the Mackenzie Delta-Beaufort region, with its petroleum resources. The ideal boundary would leave each territory with sufficient renewable resources to maintain the subsistence economy and sufficient non-renewable resources to provide an adequate revenue base. Unfortunately, each side is reluctant to compromise.

Since all orders of government and most residents favour division, the federal government should press the Constitutional Alliance to act. Uncertainty about division colours all aspects of northern development, and doubts about the fate of the territory have slowed economic growth, hampered settlement of land claims, and retarded devolution. Hence, Commissioners recommend that the Government of Canada give the Constitutional Alliance an early deadline for establishing the boundary internally. Failing an internally-generated and ratified agreement, we believe that the federal government should establish an independent boundary commission. This body would hear arguments from the two constitutional forums and make recommendations concerning a boundary. Although, ultimately, it would be the duty of federal and territorial governments to ratify any boundary chosen, no division should be forced on the people of the Northwest Territories.

Ownership and control of resources in western Keewatin and the Beaufort-Mackenzie Delta region would no doubt remain temporarily with the Crown in right of Canada. A long-term solution would probably involve agreement between Nunavut and the Western Territory to share resource revenues and/or to accept transfers of federal revenues in place of revenues from non-renewable resources. For renewable resources, such as wildlife and fish, the two territories should work out joint management and harvesting strategies. Such resources, particularly caribou, migrate annually over a wide area and exhibit a particularly irreverent attitude to political boundaries in the course of their wanderings.

After territorial division, the WCF and the NCF should decide the structure of government, respecting, of course, the Charter of Rights. Ideally, institutions should reflect the political values of all Northerners, protect aboriginal rights, and represent minority interests fairly. The federal government should encourage creativity and innovation in the development of new and uniquely northern institutions, although the Charter of Rights will necessarily set the broad guidelines for the range of legitimate options.

It appears reasonable to approve a longer residence requirement for voters to protect the fragile social structure of the Northwest Territories and Yukon from the harmful effects of massive immigration of temporary residents to work on development projects. Commissioners suggest, however, that the requirement should be two or three years of residence, not ten. Similarly, while special political status might protect ethnic and cultural minorities, such status should not compromise the basic democratic principle of representation by population. The federal government must ensure that the new institutional arrangements do not contradict the spirit of the Canadian constitutional tradition.

Creation of two new territories will make Canada's North "more governable"; will give considerable satisfaction to the region's inhabitants, particularly the Inuit of the eastern Arctic; and will better accommodate different rates of political and constitutional development in the various areas of the region. However, the new institutions that division will require will cost more than those of the present system, at least in the beginning. The Government of the Northwest Territories and the two constitutional forums must therefore accept federal involvement in institution-building where federal appropriations will be affected.

When division of the Northwest Territories would occur would depend on several factors: a boundary settlement, cost of the transition and the provision of federal funds to pay for it, and availability of public servants and infrastructure to support the new government of Nunavut. To staff the public service would take time, and the process might delay establishment of Nunavut. The predominantly-Inuit Eastern Arctic wants a government sensitive to the cultural needs of Native residents and able to conduct its affairs in the Inuktitut language. Thus an imported bureaucracy, even one that would serve only for the first years of the new territory's existence, would defeat one of the main goals of the creation of Nunavut. The hard reality, however, is that few Inuit have the background or training to staff senior management and technical positions in the public service. The federal and territorial governments should therefore evaluate existing educational, training and development programs for Northerners with a view to creating a comprehensive program to prepare Native people to staff Nunavut's public service. The same type of program could also increase the number of Native Northerners in senior positions in the Western Territory.

National Issues and Northern Perspectives

Some issues of national concern have distinctive northern dimensions and special significance in the North. Commissioners review three of these in order to emphasize that all Canadians must be sensitive to the distinctive character of Northern aspects of national policy.

The Northern Ecology

The Canadian North constitutes one of the last unspoiled ecosystems in the world. It is not simply a Canadian treasure, but part of the world's natural heritage. Sections of this Report have noted the need for caution in developing non-renewable resources. Commissioners have warned against destroying the base for the traditional Native economy, emphasized preservation of renewable resources, despite the desire to develop gas, oil and mineral resources, and urged protection of endangered species, habitats and ecosystems. Over and above all these considerations, however, Canadians must recognize the intrinsic value of the northern ecosystem. We must all learn to value wilderness – the unspoiled aesthetic virtue of the North – in the way that Northerners do. There are convincing practical arguments for respecting the northern environment, and they supplement the awareness, particularly strong among Native peoples, that the environment is the very ground of our existence and instrinsically worthy of our respect and even of our awe. We Canadians must never allow short-term economic strategies, however attractive, to destroy our North, which we hold in trust for the future.

International Trade

Much of this Report has looked at Canada's international trade prospects. More specifically, it has concentrated on Canadian relations with our closest trading partner, the United States. Northerners have a common interest with all Canadians in trade with the rest of the world, but two issues may be of special concern to them: trade with Alaska, and trade with the entire circumpolar region.

The major flow of Canada-U.S. trade is between Canada and the continental United States, but trade between Alaska and Yukon is of great importance to Northerners. The Yukon government and a number of interest groups have suggested freer economic relations with Alaska. Commissioners recommend research on a special bilateral trade agreement affecting the far northwest. Yukon's only access to ocean is through the Alaskan ports of Haines and Skagway. Some Canadians have suggested that Skagway, which has land links with the rest of Alaska only through highways in British Columbia and Yukon, could become a "free port".

Some Northerners would like to further relations with other parts of the circumpolar region. The Inuit of Canada share linguistic and cultural ties with Greenland, Alaska and the Soviet Union. They have formed the Inuit Circumpolar Conference to maintain cultural ties and to address problems of common Arctic concern. Spokespersons for the Canadian Inuit have indicated a desire to see these links sanctioned officially. They want to foster international efforts to protect the Arctic environment, and they wish to facilitate economic and cultural exchange among the circumpolar peoples.

Technological Innovation and Arctic Sovereignty

There are urgent reasons for Canadians to develop technology suitable for the Arctic. Given our oil and gas exploration in the Beaufort Sea and our permafrost studies relating to pipelines, we should be developing a comparative advantage in such fields. Even more important, Canada must affirm legal and technological sovereignty over the Northwest Passage and other Arctic waters. Indeed, it is essential to maintenance of Canadian sovereignty in the Arctic that federal and territorial governments support research and development in technologies appropriate to the region. As one participant pointed out in a seminar sponsored by this Commission, the former is meaningless without the latter:

> *If Canada is to exercise the necessary control to maintain the sovereignty it claims to have acquired over the waters of the Northwest Passage, it must develop a full range of sea- and land-based services to ensure that its control is factual and effective . . . it should be able to provide the following services: marine navigational aids; icebreaking and escorting; marine search and rescue; marine emergencies/pollution control; marine mobile communications services; ports, harbours, and terminals; vessel inspection services; vessel traffic management; marine resupply administration and support; pilotage; and training.*[2]

Conclusions

There are many issues of concern to Northerners that Commissioners have not specifically addressed in this section. We consider these issues as among national priorities, and we address them elsewhere in this Report. We wish to emphasize here, however, that the distinctive interests of Northerners, both Native and non-Native, must receive the same consideration as those of Canadians in the provinces. Canada must integrate the Northern territories into the federation so that their people can enjoy the rights and privileges enjoyed by other Canadians. The Northern territories must gradually be granted powers equivalent to those exercised by provinces in the South. In this way, we can foster the distinctiveness and diversity of the North, thus enriching the Canadian cultural fabric, while giving Northerners the opportunity to participate equally in the full benefits of the national community.

Notes

1. Background information on the North is contained in the volume *The North*, vol. 72, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985). Commissioners are also grateful for the enthusiastic response of Northerners in the hearings process and for their informative submissions.

Aboriginal Self-Government

As Commissioners have noted, issues emerge from time to time concerning the status of particular groups within the Canadian community. At such times Canada has used institutional and constitutional mechanisms to help resolve these concerns. The experience of aboriginal peoples reveals how difficult it is to accommodate their aspirations for enhanced status and social and economic improvement within the existing constitutional and institutional framework.

Many actors in many forums have tried to improve the conditions of aboriginal peoples and to increase their influence on decisions that affect their lives. There have been federal-provincial discussions, land-claims negotiations, court cases, direct appeals to the Crown, and representations to international bodies such as the United Nations. Issues involved have included: recognition of aboriginal and treaty rights, the vote, provision of health and housing services, facilities for aboriginal people in urban Canada, compatibility of resource development and environmental protection, and, most recently, aboriginal self-government.

Self-government is the most prominent aboriginal issue today. Some aboriginals claim an inherent right of sovereignty, in which they include self-government. Others see self-government as a pre-condition to solving the social, cultural and economic problems facing aboriginals. The primary official forum for discussion of aboriginal self-government has been the series of constitutional meetings instituted as a result of section 37 of the Constitution Act, 1982.

Discussion of self-government has not fully taken into account the implications of various reform proposals for the Canadian constitutional order. Proposed models of aboriginal self-government vary in their compatibility with the overall structure of Canadian government and the rights and obligations of Canadian citizenship. Therefore, the outcome of the debate over aboriginal self-government will affect relations of aboriginal peoples, not only with the governments of Canada, at the federal, provincial and municipal levels, but also with other Canadians. Commissioners believe it important to ensure that the approach ultimately taken conforms broadly with the institutional and constitutional structure of Canada, particularly with Parliament, federalism and the Charter of Rights.

The position of aboriginal peoples in Canada also has international implications. Canadian aboriginals have established, and will undoubtedly further develop, contacts with aboriginal groups in other lands to exchange information and to improve their understanding of matters of common interest. Moreover, international organizations have demonstrated significant interest in aboriginal affairs, and this interest extends to the condition of aboriginal peoples in Canada. Since these matters will remain of interest to some members of the international community, this country's record will be subject to review and criticism. No transfer of decision-making authority in the form of self-government, however comprehensive, will relieve our national community from its ultimate responsibility for the well-being of aboriginal people, as for all Canadian citizens. The discussions under way, therefore, deeply affect each of us.

Commissioners' primary focus is the compatibility of aboriginal self-government with the Canadian constitutional system. We believe that it is important, however, to consider aboriginal goals and aspirations for self-government, and the social, economic and historical circumstances out of which they have developed.

Social and economic statistics gathered by Statistics Canada and other agencies are disturbing. Life expectancy for aboriginal Canadians – status Indians, non-status Indians, Métis and Inuit – is ten years less than for non-aboriginal citizens. The incidence of alcoholism among aboriginal people in 1982 was 13 times that for non-aboriginals. About 10 per cent of the prison population is Native, a proportion that represents about five times the ratio of Native people to Canada's overall population.

The 1981 Census of Canada reported that four in ten aboriginal people had never attended high school; for non-aboriginal Canadians the figure was two in ten. The proportion of aboriginal income made up of government-transfer payments was more than double that for non-aboriginals. The percentage of aboriginal families headed by single parents was almost double that of non-aboriginal families. More than 16 per cent of aboriginal homes were in need of major repairs, and one in six was overcrowded; the figures for non-aboriginal homes were 6.5 per cent and one in 43, respectively.

The 1984 Royal Commission Report on Equality in Employment[1] found aboriginal people concentrated in low-paid, low-skill jobs, with aboriginal men earning 60.2 per cent of the average income for non-aboriginal men, and aboriginal women earning 71.7 per cent of the average income for non-aboriginal women. In this Commission's hearings in Victoria, the United Native Nations, a B.C. provincial organization representing off-reserve, non-status Indians and Métis, told us that 60 per cent of Native people living in Victoria were unemployed, 82 per cent lived under the poverty line, and 95 per cent had not completed Grade 12.[2]

Many aboriginal groups argue that census and survey statistics such as these reflect the fact that Native peoples live in a culture not their own, where important decisions affecting their lives and their children's futures are beyond their control. Witness after witness appearing before the House of Commons Special Committee on Indian Self-Government in Canada (the Penner Committee) in 1983 spoke of a "legacy of injustice, exploitation, bureaucratic insensitivity and non-Indian self-interest".[3]

Although relations have evolved between status Indians living on reserves and the Government of Canada, they remain circumscribed by the Indian Act which was first enacted in 1876. The Indian Act is based on federal jurisdiction as laid out in the Constitution Act, 1867, section 91(24): "Indians, and Lands reserved for the Indians". Until the end of the Second World War, the Indian Affairs Branch took a custodial approach to its responsibilities for Indians. Indeed, benign neglect and indifference often characterized the administration of Indian affairs. However, several factors led to gradual changes in attitudes and policy toward Indians after the war: there was increased acceptance of a positive role for the state in promoting the economic and social well-being of its citizens; governments acquired greater administrative capacity; citizens became more conscious of their rights; and the end of formal European colonialism in Africa and Asia helped to focus attention on the conditions of indigenous peoples elsewhere.

The federal government revised the Indian Act in 1951. Then, in 1960, it extended the vote in federal elections to all Indians; prior to that date, status Indians had usually been required to give up their status to obtain the right to vote in federal elections. The tempo of policy change quickened during the 1960s. The federal government made groping attempts, reflected in policy initiatives, policy reversals and new programs, to come to terms with the long history of neglect toward Indians under federal jurisdiction. It set up community-development programs and Indian advisory boards, increased its grants to Indian bands, and transferred some responsibilities to provincial governments. These steps met with mixed success.

In 1966, a thorough examination of the conduct of Indian affairs, *A Survey of the Contemporary Indians of Canada* (Hawthorn Report),[4] recommended rejection of assimilation or integration as a policy option in favour of retaining special status for Indians. The report suggested that Indians should be regarded as "citizens plus": they should possess general rights and duties of citizenship, and additional rights as charter members of the Canadian community. The report recommended that the Indian Affairs Branch ensure that the "plus" aspects of Indian citizenship be respected. In its 1969 *White Paper on Indian Policy*, however, the federal government adopted a different approach, recommending repeal of the Indian Act and the special status it afforded Canadian Indians. The Indian people resisted the 1969 proposals, and the federal government subsequently dropped them.

A policy of devolution, or the transfer to individual bands of responsibility for managing and delivering services, began in the late 1960s and continued through the 1970s. Funds from the budget of the Department of Indian Affairs and Northern Development, administered by bands, increased steadily from $34.9 million in 1971 to $526.6 million in 1982–83, a fifteen-fold increase. Although the federal government passed responsibility for delivery of services to the Indians, it kept control of programs and budgets.

During the 1970s, grants and contributions to bands and associations, as well as to provincial governments, more than doubled as a percentage of the Department's budget designated for Indian and Inuit affairs. This is testimony not only to the transfer of responsibility but also to increased federal funding of Native associations. Extensive government financial support for political organizations, channelled primarily through the Department of Indian Affairs and Northern Development and the Secretary of State, eventually allowed status and non-status Indians and Métis to articulate their demands for reform. This politicization has made both aboriginals and non-aboriginals much more aware of the needs of Canada's Native peoples.

Financial support for political organizations helped mobilize aboriginal peoples. Métis and non-status Indians became increasingly visible in political life in the 1970s as the concept of "aboriginal" evolved and grew to encompass a much larger population than just status Indians. This broadened understanding of aboriginal ethnicity led to the inclusion of Indian, Inuit and

Métis peoples in the constitutional definition of "aboriginal peoples" contained in section 35 of the Constitution Act, 1982.

The enlarged definition of aboriginal peoples has compounded the difficulties in thinking about their many problems and grievances. It is difficult, for example, even to define and assess the size of the component groups. The constitutionally recognized categories of Indian (status and non-status), Métis and Inuit are ambiguous. Status, or registered, Indians are persons accorded status by the Indian Act whose names are recorded on a register kept by the federal government. The 1981 Census reported approximately 290 000 status Indians. However, Department of Indian Affairs and Northern Development 1985 population projections place the number of status Indians at 366 000. The Inuit, approximately 25 000 in number, live beyond the tree line. They comprise a distinct cultural group, and a substantial majority of them speak Inuktitut.

The boundaries of the remaining two categories of aboriginal peoples overlap and are indistinct. Non-status Indians are formerly registered Indians who lost their status through enfranchisement, Indian women who lost their status through marrying non-Indians, or descendants of members of these two groups. The core Métis population are descendants of people of mixed aboriginal and European ancestry who lived in Western and Northern Canada and possessed a distinct socio-cultural identity in the nineteenth century. However, there is no universally accepted definition of "Métis". The term is sometimes used to refer to all people of mixed aboriginal and non-aboriginal ancestry who lack legal Indian status. As a result, non-status Indians sometimes identify themselves as Métis and vice versa. Using self-identification, the 1981 Census counted approximately 173 000 Métis and non-status Indians; but other estimates range as high as 300 000 to 435 000. Métis and non-status Indian organizations, in particular, dispute the 1981 Census figure. For instance, in Ontario alone, the political organization for Métis and non-status Indians claims to represent 185 000 people. In addition to the core population of Métis and non-status Indians, between 400 000 and 600 000 others identify themselves for certain purposes as part of this group.

If and when Parliament passes Bill C-31, a bill to amend the Indian Act, it will cast into a state of flux the categories of status and non-status Indians. The federal government estimates that the amendment would permit 68 000 non-status Indians to apply for registration under the Indian Act and for the rights and benefits associated with this status. This estimate includes 16 000 women who lost their status because they married non-Indian men and 6000 people who were enfranchised under a particular section of the Indian Act for reasons now deemed unfair, such as joining the armed forces or completing university. The other 46 000 people who could apply to have their status reinstated are first-generation descendants of these people. The enlarged category of aboriginal peoples, and the fluidity of their component groups, raise complicated and serious policy questions, in particular about self-government.

Aboriginal claims for self-government are an understandable response to social, economic and historical circumstances and are in accord with the political awakening evident in aboriginal populations around the world. Commissioners recognize the need to enhance aboriginals' decision-making capacity and autonomy, based on the distinctive place of aboriginals in Canadian society as the first peoples of Canada, and on the broadened constitutional recognition they now enjoy.

According to a research study done for this Commission,[3] aboriginal peoples in Canada seek greater self-determination and social justice, economic and social development, and protection of aboriginal cultures through self-government. They want greater control over their own destiny and an end to their subordination to political and bureaucratic authorities outside their own ethnic group. They seek economic development to end their poverty and unemployment, and they expect self-government to contribute to that result. They also consider self-government to be an important prerequisite in addressing social problems.

Many Canadians, who deplore the historical and continuing injustices visited on Canada's aboriginal peoples, recognize and support aboriginal goals for self-government. But while the goals are clear, the way to realize them is not. Commissioners doubt that aboriginal self-government, which remains an ambiguous concept, is the surest means of achieving all aboriginal goals. Indeed, we are concerned that the single-minded pursuit of self-government might unwittingly delay the massive effort which is needed to solve the major social and economic problems of aboriginal communities. Nevertheless, the process of defining self-government has already begun within the framework of constitutional discussions; and Canadians must assess it in terms both of its capacity to meet aboriginal aspirations and of its compatibility with our system of government.

Models of Aboriginal Self-Government

The concept of aboriginal self-government does not imply any single model or form of institutional arrangements. It is therefore exceedingly difficult both to assess the capacity of self-government to satisfy aboriginal goals and to assess the compatibility of what is still an abstract concept with the Canadian system of government and the principles of Canadian citizenship.

We should think of a continuum of models, based on the origins or derivation of authority. Near one end of the continuum is the model contained in the federal government's 1969 *White Paper on Indian Policy*: bands would acquire municipal status under provincial jurisdiction. Nearby on the continuum is the proposed legislation for band government developed by the Government of Canada following abandonment of the *White Paper* policy: a band was to be a federal municipality operating under enabling legislation and exercising delegated authority. These and similar proposals have a legislative, rather than a constitutional, foundation: on this basis, aboriginal governments would exercise delegated authority.

In contrast are proposals which give aboriginal governments a constitutional basis, with guaranteed jurisdiction similar in principle, although not necessarily in scope, to that of provincial governments. The Penner

Committee made such a proposal, recommending the establishment of Indian First Nation governments. The committee recognized the symbolic importance of the term "First Nation" to Indian aspirations for self-government and used it in its report, in order to make it more familiar to the Canadian public.

> *In recent years indigenous peoples have given new expression to their distinctiveness and their origins. Names have assumed a special significance . . . Indian peoples in Canada have thus extracted from history an English term that had been used in the Royal Proclamation, in treaties and in major legal decisions in the United States – the word 'nation'. Together they refer to themselves as 'First Nations', a term with historical and political significance.*[6]

Although the terms of reference of the Special Committee had restricted its mandate to the study of band governments on Indian reserves, the form of self-government it recommended could be extended to any aboriginal community with a land base.

The Penner Committee recommended that "the right of Indian peoples to self-government be explicitly stated and entrenched in the Constitution of Canada." The Report stated emphatically:

> *The surest way to achieve permanent and fundamental change in the relationship between Indian peoples and the federal government is by means of a constitutional amendment. Indian First Nation governments would form a distinct order of government in Canada with their jurisdiction defined.*[7]

The extreme position at this "constitutional" end of the continuum views self-government as an aboriginal right based on the Royal Proclamation of 1763, which in organizing governments for Britain's newly acquired North American territory had recognized aboriginal rights to lands not formally surrendered. According to this concept, aboriginal sovereignty was never relinquished, and it is the basis of self-government; the right to self-government is therefore already present in the Constitution Act, 1982, as an integral part of the aboriginal rights protected under section 35. At the Constitutional Conference of First Ministers on Aboriginal Constitutional Matters, in March 1984, for example, Chief David Ahenakew of the Assembly of First Nations stated:

> *The federal government cannot give us self-government. It has never been yours to give. It has always been ours. You can recognize it, enhance it, facilitate it, but if you were to give it to us or devolve it to us or permit it to us it would not be self-government.*[8]

Aboriginal associations and councils participating in the current discussions have shared the position that true aboriginal self-government must have a constitutional, rather than a legislative, foundation. Prime Minister Trudeau's promise at the 1984 First Ministers' Conference to include in the Constitution the right of aboriginal peoples to self-governing institutions represented the federal government's acceptance of a constitutional basis for aboriginal self-government. However, seven provinces at the 1984 Conference did not support constitutional entrenchment.

At the April 1985 First Ministers' Conference on The Rights of Aboriginal Peoples, Prime Minister Mulroney sought support for a constitutional amendment from the required number of provinces and the participating aboriginal associations. Seven provinces seemed to be prepared to support a compromise constitutional amendment which would affirm, in principle, the right of aboriginal Canadians to self-government, within the context of the Canadian federation; it would, however, leave to a political accord any further commitment to negotiate terms of self-government. The support of a number of these provisionally supportive provinces was conditional on the acceptance of the amendment by the aboriginal associations, but this agreement was not immediately forthcoming. The Conference therefore adjourned without reaching agreement, and the question of how to implement self-government remains unresolved. A number of provinces expressed concern about how aboriginal government would be integrated into the existing institutional and constitutional structure. Nevertheless there is now a greater sense that the federal and provincial governments are prepared to accept the goal.

Implementing Aboriginal Self-Government

Everyone engaged in the debate about aboriginal self-government recognizes that if and when agreement is reached on the basis of authority for aboriginal governments, legislation will have to provide for the recognition and implementation of this new status. Such legislation must state how membership in self-governing aboriginal communities will be determined, stipulate the means of recognition, and define the powers to be exercised.

There have been discussions between the federal government and Indian representatives on legislation to establish the framework of Indian Nation governments. Bill C-52, which dealt with self-government for Indian Nations, died on Parliament's order paper in June 1984; it was a first attempt to formulate such a framework. Although this draft legislation pertained only to Indians and not to the wider aboriginal community, it did not settle the form and substance of self-government for even this one component group. Proponents of self-government recognize, moreover, that since the varying aspirations and diverse circumstances of different Indian and other aboriginal nations throughout Canada may require different types of arrangements, each aboriginal government could possibly exercise a unique set of powers. The Penner Report, Bill C-52 and Prime Minister Mulroney, in his call to proceed on a case-by-case basis, have each recognized this possibility.

Most discussion of self-government assumes the existence of a land base or a territorially defined jurisdiction. However, aboriginal self-government which requires a land base would exclude a large heterogeneous segment of the aboriginal population: most non-status Indians, those Métis living outside communities where they form a majority, and the approximately one-in-four status Indians who do not live on Indian reserves or Crown-land settlements. Their interests might be overlooked by an approach to self-government which concentrates on a land-based model.

The size and wealth of existing status-Indian and Métis communities (which differ greatly in population, extent of land base and natural resources, level of community and personal wealth, and geographic remoteness) impose additional constraints on land-based self-government. Seventy-two per cent of the status-Indian population, approximately 216 000 individuals, lives on more than 2000 reserves. There are 579 bands, which are generally recognized as the principal units for self-government; their average population is 516 members, but 48 per cent of the bands have fewer than 300 members. The large number of relatively small communities poses many problems for self-government, including serious diseconomies of scale. Nevertheless, administrative complexities, distance between communities, cultural diversities and distinctive histories reduce the prospect of amalgamating bands.

Many of the existing communities have only weak fledgling economies. Even after receiving land-claim settlements, resource revenues and any additional land grants from governments, many communities will need ongoing financial assistance. Most of the local communities that might receive powers of self-government are, in effect, small villages with limited resources.

It is difficult to conceive of a form of self-government that is not territorially based. However, if our goal is to provide greater autonomy for all the aboriginal people of Canada, we cannot ignore the fact that many of them (perhaps 75 or 80 per cent, according to one estimate)[9] lack a land base or live outside communities where aboriginals represent a majority. Indeed, aboriginal leaders, especially some Métis, have tentatively begun to explore possible forms of self-government which are not territorially based. Self-government premised on jurisdiction over individual dispersed citizens could, for example, grant taxing powers or make unconditional transfers to one or more pan-Canadian aboriginal authorities which, in turn, could deliver services or make transfer payments to individual aboriginal Canadians. Once constitutional discussions have more clearly defined the aboriginal and treaty rights which are recognized by section 35 of the Constitution Act, 1982, pan-Canadian aboriginal authorities could assume some form of responsibility based on any, or all, of these rights. Commissioners remain sceptical, however, that Canadians can develop workable models which would be both acceptable to the Canadian aboriginal community and reasonably efficient, and which would respect Canada's constitutional order. Accordingly, while we do not entirely reject the idea of limited self-government without a land base, we believe that other solutions will have to be found to solve the problems and satisfy the aspirations of the large majority of the aboriginal population who cannot look forward to a territorial jurisdiction.

How would self-governing, land-based aboriginal communities relate to federal and provincial governments and to the intergovernmental system? Aboriginal governments might exercise either constitutionally based authority or delegated authority. Such governments would almost certainly differ from one another in the extent of their jurisdictions and might also differ in their respective mixes of national and provincial jurisdictional powers: under section 91(24) of the Constitution Act, 1867, Parliament could delegate jurisdiction that was otherwise provincial to such self-governing communities. Moreover, it could do so in varying degrees for different communities and in combination with varying amounts of delegated federal jurisdiction which would continue to apply to other Canadians. In its report, the Penner Committee proposed that "Parliament should move to occupy the field of legislation in relation to 'Indians, and Lands reserved for the Indians' and then vacate these areas of jurisdiction to recognized Indian governments." The report recommended that this be done "in all areas in which Indian First Nations wished to exercise jurisdiction."[10]

Although the legal and constitutional situation is complex, the federal and provincial governments might be able also to delegate special mixes of powers to those aboriginal communities which are not covered under section 91(24) of the Constitution Act, 1867. The complexities would be further compounded if particular self-governing aboriginal communities were to bridge the gap between their jurisdictional authority and their actual administrative and fiscal capacities by arranging for either level of government to provide programs.

There are complex practical issues relating to the manner in which such governments, with their potentially distinct mixes of powers, could fit into the structure of Canadian federalism. Self-governing communities that exercise powers delegated by the federal government pose fewer problems; presumably, the federal government could act on behalf of such aboriginal governments in the intergovernmental arena. The matter might not be so simple, however, in the case of aboriginal governments which possess constitutionally recognized authority. There could develop a very large number of sovereign self-governments representing a distinct order of government. The intergovernmental complexities of federalism could not successfully accommodate even a small proportion of these governments, either at the federal-provincial bargaining table or in more focused arenas where the governments of the federal system meet.

This problem cannot easily be overcome by accepting aboriginal associations as substitutes for the leaders of self-governing communities because participants in intergovernmental arenas must possess executive authority, and must be capable of delivering on their commitments. In order for aboriginal associations to be able to negotiate and accept agreements without worrying that individual community governments might repudiate them, they would themselves have to possess the status and authority of governments. If this were so, however, the widespread premise that the local community is the essential unit of self-government would be invalidated. Accordingly, Commissioners recommend that future discussions of aboriginal self-government clearly address the issue of how to fit such governments into the intergovernmental arena.

Several problems immediately become apparent. Given that aboriginal self-governments possessed sovereign authority, the legitimacy of their members' exercising the federal and provincial franchises would be questionable if the jurisdiction of self-governing communities overlapped significantly with that of either or both orders of government. It would not be easy to resolve this dilemma by having representatives of aboriginal constituents vote only on those matters where aboriginal governments did not wield jurisdiction; in virtually all instances, aboriginal voters are intermingled in particular constituencies with non-aboriginal voters. While all functioning political systems contain anomalies, their multiplication should not be an unthinking consequence of policy directed to other objectives. Commissioners recommend, therefore, that discussions of aboriginal self-government address its compatibility with the possession of the federal and provincial franchise.

Self-government entails recognition of the collective rights of particular aboriginal communities. This raises difficult questions about the individual rights of members of those communities. Some observers have suggested that if self-government is given a constitutional basis, then section 25 of the Constitution Act, 1982, dealing with aboriginal rights and the Charter, is relevant, and it follows, therefore, that the Canadian Charter of Rights and Freedoms does not apply. However, the federal government's draft legislation enabling the establishment of Indian Nation governments through the delegation of authority explicitly provided for Indian Nation constitutions to be consistent with the Charter. Further, it stipulated that an Indian Nation government could not pass legislation in conflict with the Charter, and that the Governor in Council would hold powers of disallowance over laws of Indian Nations.

Commissioners believe that aboriginal Canadians, even as residents of self-governing communities, must retain the rights of Canadian citizenship. This entails the full application and protection of the Charter.

In conclusion, Commissioners sympathize with the aspirations of aboriginal peoples to achieve self-government. The existing situation is clearly unacceptable, and aboriginal peoples must have a larger say in determining their own priorities and governing their own affairs. The fact remains, however, that proposals for aboriginal self-government raise issues of great complexity. A solution involving land-based self-government is inapplicable to most aboriginals. Where it could be instituted, local resources and fiscal capacity are minimal, and extensive intergovernmental transfers would be necessary.

The complexities of integrating self-governing communities into the larger Canadian federal and parliamentary systems are intimidating. We understand the revived ethnic identity that stresses differences rather than a full application of the benefits and obligations of Canadian citizenship. Nevertheless, Canada must not reverse a policy which makes available to aboriginals full citizenship rights, of which status Indians in particular were long deprived. We must respect the Charter and avoid forms of self-government which would weaken the legitimacy of aboriginal Canadians' continued participation in the wider Canadian political process. Enhancement of aboriginal autonomy must not jeopardize aboriginals' continued enjoyment of the rights of Canadian citizenship.

Commissioners do not view realism as comprising a disservice to aboriginal peoples. The complexities and difficulties of self-government warrant a more detailed consideration than they have so far received.

Municipalities

Local governments in Canada are, to use a well-worn phrase, the "creatures of provincial governments". Section 92(8) of the Constitution Act, 1867 gives the provinces authority over "municipal institutions in the province". Under this constitutional head, provincial legislatures have exclusive authority to legislate on municipal matters; they cannot delegate this authority to local government or to the national government. They can, however, legislate the establishment of municipal institutions and assign to them responsibilities. Legislatures can also eliminate municipal institutions, combine them, separate them, give them added or reduced responsibilities, and increase or decrease their financial support. Strictly speaking, then, there is no constitutionally distinct municipal level of government.

But Canadian local governments are very robust "creatures" indeed. Despite their lack of constitutional status and the fragile legal basis on which they rest, they have proved an enduring feature of Canada's governing system. Many cities existed – albeit as much smaller settlements – before the provinces or, indeed, Canada existed as governmental bodies and the provinces grew around these settlements. The most obvious example is St. John's, Newfoundland, North America's oldest city and the capital of Canada's youngest province.

Local government, as this Commission was told repeatedly during our hearings, is big government. Canada's two largest cities, Toronto and Montreal, constitute almost half the populations of Canada's two largest provinces, Ontario and Quebec. Toronto has more people than eight of the ten provinces, Montreal more than seven. Montreal has the fourth-largest government budget in Canada, Toronto the fifth largest. Some 21 Canadian cities have more people than the smallest province, Prince Edward Island. Half of Canada's population is now concentrated in ten cities. In terms of procurement – buying goods and services – local governments, collectively, now spend more than the federal government.

In terms of the lives that Canadians lead and the concerns they have, local government is a third order of government. To many, it is the most important order, dealing with matters of the most direct and immediate concern, and providing the most accessible and effective way to take advantage of many federal and provincial programs. Indeed, a fourth order of government has emerged: regional and metropolitan governments and authorities provide common services to citizens residing in a number of neighbouring local jurisdictions. This order, too, is a creature of provincial governments.

There is immense variety in the way in which local government is carried out in Canada. No standard rule applies. Each province has authority to make laws for municipal institutions. Each legislature is supreme in the way it uses or does not use that authority. Each province has chosen its own approach to local government, producing great diversity of approaches, both among provinces and within them. Nevertheless, the provinces have tended to be very sensitive to the successes and failures of approaches taken elsewhere. Amid variety, there is a broadly shared approach to local government from province to province. The details vary, but the general direction has been similar. In different ways, for example, provinces have assumed the once-local responsibility for health, education and welfare.

If this system has not proved tidy, it has proved creative: each province effectively serves as a laboratory for every other province. The system has permitted a sensitive and flexible approach to local conditions. Relations between cities and provinces have been dynamic. There are, however, problems within this system. The obverse of flexibility is uncertainty. Provincial legislation affecting municipalities can, and often does, change unexpectedly. The instruments available to local governments, such as zoning, have been primarily negative or preventive rather than positive. Positive policy-making instruments rest with the provinces. Moreover, local government has become increasingly complex, because of both civic expansion and more sophisticated provincial legislation.

The federal government affects – on occasion decisively – the capacity of civic governments to carry out their tasks. Federal policy on interest rates is a critical factor in local finance. The federal government is a major landholder, landlord and developer in many cities. Moreover, local decisions can enhance or diminish the effectiveness of federal policies such as those relating to housing. Thus local-federal relations are critical both for municipalities and for the federal government.

To a significant degree, municipal governments depend on federal understanding of local needs and conditions; at the same time, the national economy is becoming more dependent on cities. Relations between local and federal governments are difficult to develop, however, because of the provinces' exclusive jurisdiction over local government. There are political and constitutional limits on the way federal and local governments can accommodate to their interdependence.

Canadian cities do face problems. Nevertheless, the vigour and dynamism of local governments and the communities they serve have created tremendous opportunities. Commissioners will deal with these problems and these opportunities in light of what we heard from representatives of local government and other concerned parties, and what we have learned from our own research.[1]

Canada has developed some of the most liveable cities in the world. They are clean, safe and well-equipped. Since the Great Depression, when a number of cities, as well as provinces, fell into financial difficulty, our municipalities have been well administered and financed, under provincial control and guidance.

There were many obstacles and challenges to such a happy outcome: the massive shift of people from rural to urban areas, expanded use of the automobile and resulting growth of suburban areas, a general increase in population, and the need for infrastructure to support large, complex urban societies. In addition, post-Second World War development of the welfare state complicated the picture by shifting to senior governments responsibility for matters once considered local: relief for the unemployed, welfare, health and education.

Commissioners are conscious that Canadians have been doing something right at the level of the local community, be it village, town, city or metropolis. We make suggestions and recommendations below with this fact very much in mind. We shall look at issues that we find are of general concern throughout Canada: the constitutional status of local government; intergovernmental relations, at both local-provincial and local-federal levels; revenues and responsibilities; urban policy; and the local role in economic development. These issues are closely interconnected. Indeed, many of the possibilities in the final four areas of concern turn on the approach taken to the issue of constitutional status. We shall therefore start there.

The Constitutional Status of Local Government

The fact that local governments are the "creatures" of provincial governments has far-reaching effects. The most important of these are uncertainty and legislative and institutional complexity of municipal government. Simple acts of the provincial legislature can change local government, and frequently do. Because of judicial interpretation which has prevented delegation of power to local governments, municipal acts must set out specifically what local governments may and may not do in administering policies approved by provincial legislatures. The resulting highly detailed legislation has added great complexity to local administration. "This circumstance", Marion Dewar, the Mayor of Ottawa, told us, "is a far cry from the brief division of responsibilities between the federal and provincial governments as set out in the Canadian Constitution." (City of Ottawa, Brief, November 31, 1983, p. 10).

One immediate consequence is that municipal councils must approve every administrative action that implements a policy and often are bogged down in administrative detail that might be better delegated. While this makes decision making more open than it is at the federal and provincial levels, it also diverts time and attention from broader questions that may affect far more of a community's citizens.

The provinces have used their authority to create not only local governments, but also a whole range of special-purpose commissions, boards and authorities. The City of Toronto, for example, has within its borders some 101 provincially created authorities. Some of the provincially created boards provide means for local citizens to appeal decisions made by local councils or other administrative boards, but such appeals are complex and expensive.

The very confined nature of municipal planning powers sharply constrains the capacity of local governments to plan in a positive way, that is, to set out development goals and standards. In effect, provincial law and judicial interpretation have confined local governments to negative approaches to the control, rather than the stimulation, of urban development. Zoning, approving subdivisions, and making land-use plans are activities typical of this approach. Such devices allow a city to prevent certain uses of property by private owners. They prevent some of the worst abuses in development, but they are very cumbersome; in fact, they may discourage and occasionally prevent some of the best types of development.

Discretionary forms of control such as spot zoning, holding zones, development reviews, and "minor" adjustments approved by committees of adjustment have circumvented this limitation. However, as our research indicates, this tendency has transformed zoning from a system based on clearly defined rules to one based on political bargaining. Municipal councils find themselves squeezed by provincially established limits on their powers to direct development toward approved goals, private developers' plans for the use of their property, the need to expand the main basis of municipal revenue, the property tax, and the resistance of property owners adversely affected by development.

In our hearings, we Commissioners heard proposals to resolve some of these problems by giving local governments explicit constitutional status as a distinct order of government, with clearly defined powers and responsibilities. For instance, Mayor Elizabeth Kishkon of Windsor put to this Commission the City's recommendation that:

> *In light of the importance of local government to the majority of Canadian citizens, both in terms of direct provision of service and as a major force in the economy, municipalities be formally recognized in the Canadian Constitution as the third level of government with a guaranteed right of existence.*
>
> (City of Windsor, Transcript, Windsor, October 13, 1983 [vol. 25], p. 4721.)

Mayor Dewar of Ottawa went even further, suggesting that a number of Canada's major cities should become "provinces".

Commissioners did not detect, or expect, great enthusiasm from the provinces for providing the cities with clear and constitutionally based powers. We observed no enthusiasm whatsoever for transforming any major city into a province in its own right. While we agree that constitutional status could resolve a number of concerns of local governments and might simplify provincial administration by placing urban policy in the hands of the governments most sensitive to cities' needs – that is, local governments – we heard a number of cautionary voices. Dr. John Graham told us in Halifax: "We don't want another layer of jurisdiction with certain sovereign powers unto itself. Surely we have a complicated enough system." (John Graham, Transcript, Halifax, June 6, 1984 [vol. 6], p. 1275.)

Although constitutional status for municipalities might rather simplify Canada's governmental system than complicate it, Commissioners heard others question the proposal, not so much for cautionary reasons as for practical ones. Paul Godfrey, representing the Municipality of Metropolitan Toronto, put the practicalities to us this way: "We have gone through that process before . . . I do not want . . . to come out and call for a role in the Constitution because I do not believe that will happen." (Municipality of Metropolitan Toronto, Transcript, Toronto, December 1, 1983 [vol. 55], pp. 11525, 27.)

Others focused their attention and energies on matters they considered of higher priority. Michael Harcourt, Mayor of Vancouver, argued that Canada is changing from an Atlantic-based economy to a Pacific-based and more urban economy. These trends, he said, are important "whatever our Constitution says – and the Constitution is almost irrelevant in that context." (Michael Harcourt, Transcript, Vancouver, June 11, 1984 [vol. 9], p. 2123.)

Commissioners deduce from these comments and others made by representatives of other cities and by intervenors at our hearings that some local leaders favour a secure status in the Constitution. Even these leaders, however, do not expect to obtain what they wish and are inclined to seek other, more attainable objectives. Because we concur in this general assessment, we do not recommend explicit constitutional status for municipal governments. We do, however, suggest that each provincial government systematically examine relations between itself and its local governments. Together with municipal leaders, provincial governments should address the growing complexity of those governments, the insecurity of financing, and the mismatch of revenues and responsibility. Together they should look for ways to harness the undoubted capacities of municipal administrations. Such constructive discussions may well indicate that in some provinces, both municipal and provincial governments would benefit from an enhanced or a constitutional status for major cities. Should that prove so, Commissioners see no impediment to a single province seeking an amendment to the Constitution Act that would specify the constitutional status of one or more cities within its boundaries. Alternatively, a province could enter into a binding arrangement under the intergovernmental agreement clause we have proposed for the Constitution. In any case, such examination and discussion seem essential in order to improve relations between local governments and both provincial and federal governments.

To deal with the uncertainty which local governments feel about possible alterations to their powers, Commissioners recommend that provinces consider adopting special procedures for changing local responsibilities. The most straightforward mechanism would be a regulation that changes to municipal acts or city charters require approval of two-thirds of the members of a provincial legislature. In most provinces at most times, this would necessitate that the government and the opposition agree on proposed changes. An alternative, affording even stronger protection, would be a referendum either on a province-wide basis or in the municipalities affected by a major change.

Intergovernmental Relations

For much of the last quarter-century, intergovernmental concern has focused on the state of federal-provincial relations. There are two other intergovernmental relationships, however, that are of increasing importance. The first is the relationship between provincial governments and local governments, and the second is the relationship between the national government and local governments, in particular the governments of Canada's largest cities.

As we have remarked, one of the social changes of the post-war years has been the urbanization of Canada. Three-quarters of Canada's citizens live in urban areas, with most concentrated in a few cities. The non-urban economic sectors, agriculture and resources, have declined in relation to the urban sectors of manufacturing and services. This trend appears likely to continue for a time.

All of these factors suggest to Commissioners that interdependence among governments will increasingly involve issues of concern to local governments. The fact that local governments have no status under the Constitution, however, impedes improvement of relations among the three orders of government. To promote the best delivery of government programs, many of them related to job creation, the federal government has preferred to deal directly with local governments. The potential advantages of a direct federal-local relationship are significant: the shorter the lines of communication between national and local leaders, the better their understanding of one another is likely to be and the greater the probability of joint success. The provinces, however, have insisted that in accordance with the Constitution, federal relations with local governments be conducted through provincial offices. They argue that even where local governments are administering federal programs or spending federal money, direct federal relations with those governments constitute an intrusion into an area of provincial responsibility. Constitutionally, this contention is correct, even if the activity in question is clearly in the federal jurisdiction. Thus conflict arises between what is practical and what is constitutional.

Since it is unlikely that the Constitution will be amended to change this situation, governments of all orders must find an alternative means to improve their relationships with one another. In fact, they have already tried a number of means. One was the tri-level conference, attended by federal, provincial and local representatives. Such conferences took place in the 1970s, but none has been held recently. Various representatives of municipalities suggested to this Commission the possibility that such conferences might be held in the future. Commissioners endorse this approach as a useful way for each level of government to appreciate the situations faced by the others. It might be advantageous on occasion, to schedule tri-level meetings in conjunction with federal-provincial First Ministers' meetings.

Another attempt to improve intergovernmental relations was the creation of a federal Ministry of State for Urban Affairs. This ministry, created in 1971, was disbanded in 1979. A number of spokespersons for local governments suggested that the federal government re-establish such a department to provide a forum for direct dealings between municipal authorities and the federal Cabinet and senior bureaucracy. While Commissioners believe that this idea has some merit, there are grounds for hesitation. The proliferation of advisory ministries within the federal administration has contributed to the growth of government, increased its complexity, and reduced the capacity of any particular advisory ministry to be either fully aware of, or to represent the interests of, those whom it was intended to represent. In addition, most matters affecting local government also affect provincial interests. The creation of a federal ministry of urban affairs, therefore, might simply improve federal-municipal communication at the cost of making federal-provincial communication more difficult. Commissioners conclude that the municipal interest lies in better communication with those ministers whose responsibilities directly affect local interests: for example, the Ministers of Finance, Transport, Public Works, Regional Industrial Expansion, and the minister responsible for housing policies.

An alternative to the creation of a new ministry might be the use of parliamentary processes to anticipate and to monitor the effect of federal measures on local administration. This means could provide a forum for the expression of local concerns and needs. It has the significant advantages that it is more open to public participation and scrutiny, including the scrutiny of provincial governments, and that it could serve to heighten ministerial sensitivity to local problems. Commissioners recommend that this task be assigned to the parliamentary committee on intergovernmental relations that we considered in Chapter 22.

Commissioners believe that local administration of a number of federal responsibilities would prove more responsive to local needs and conditions. Given Canada's Constitution, such responsibilities cannot be delegated directly to local governments, but must be routed through provincial governments. Since, however, the latter may be just as far removed from local concerns as the federal authorities, Commissioners do not believe that to delegate administration to provincial governments would always produce the beneficial effects desired. Decentralization of federal administration to federally-appointed bodies operating in the local areas is a preferable approach. Such a step has already been taken, for instance, in the management of harbours. Federal Port Authorities, established under federal legislation, are providing local administration in a manner that appears to be considerably more sensitive than that of the previous centralized administration.

Commissioners believe that similar approaches should be considered in two areas of considerable concern to municipalities. One of these areas is that of land management, where federal powers to expropriate, hold or develop land often produce development that is at variance with local priorities. In our hearings, some intervenors suggested that local authorities should have some responsibility for the management of federal properties in urban areas. We agree that local authorities, appointed by the federal government, could manage properties in a manner more sensitive both to local preferences and to local market opportunities.

A second area of concern is airport management, where the federal responsibility for air transportation has a direct effect on, and is directly affected by, local government development. Commissioners believe that in some instances, the establishment of local airport authorities might considerably improve sensitivity to local conditions, provide a more effective and integrated air-transport system, and improve service to air travellers. In Chapter 22, Commissioners recommended a Constitutional amendment to allow the delegation of constitutional authority among governments. This change would enable the federal government, through agreement with the relevant province, to delegate to local governments the responsibility for siting, developing and administering some designated airports. This arrangement differs somewhat from the federally established local authority model we considered for the management of federal lands in urban communities, but it offers a means to achieve a similar objective: greater responsiveness to local needs and conditions through decentralized administration of federal responsibilities.

Provincial-local relationships are also an issue of intergovernmental affairs. Because provincial governments must provide a legislative basis for all local government action, the provincial-local relationship involves considerable difficulty and requires considerable sensitivity. In the absence of constitutional amendments, which would allocate responsibilities to local governments, provinces should give high priority to examining, clarifying and simplifying the relationships each has with local governments. This action would serve to lighten the burden of both local and provincial administration. Most important, in Commissioners' opinion, it would be of significant benefit to taxpayers who find local concerns complicated by a maze of provincially created boards, agencies and public authorities dealing with poorly defined and shifting responsibilities.

Revenues and Responsibilities

In 1982, municipal government expenditures rose to $33 billion, representing, as Table 24-2 shows, over 9 per cent of the nation's gross national expenditure. Nevertheless, municipal leaders throughout the country are concerned that the anticipated expenditures they must make are vastly greater than their available resources. Municipalities have repeatedly sought sufficient fiscal autonomy, through access to sources of revenue other than the property tax, to finance the responsibilities of local government. Provincial governments, however, have steadfastly withheld that power, and so municipalities remain dependent on transfers or subsidies from the two other levels of government. Commissioners are concerned with the ways in which local governments are funded. They spend more than twice as much as they raise from taxes. This expenditure results in a dependence on revenue sources beyond their control and, consequently, uncertainty about the amount of funding provided in any given year. Long-term financial planning and budgeting is therefore extremely difficult. Moreover, municipal residents are uncertain of their ability to hold government accountable for taxing and spending.

TABLE 24-2 Sources of Local Government Revenue, 1982

	Billion $	%
Property tax	10 840.9	32.1
Corporate tax	1 237.4	3.7
Other tax	282.2	.8
Total taxes	12 361.4	33.6
Grants in lieu of taxes	945.0	2.8
Self-generated revenues	4 832.5	14.3
Government subsidies	15 608.1	46.3
Grand Total	33 747.0	100

For a variety of reasons, Canada's tri-level transfer system makes accountability very difficult, because of the size of the expenditures by one order of government that are funded from taxes raised by another. This problem of accountability is compounded for local governments by the way in which provincial subsidies are provided. In all provinces, in recent years, more and more provincial grants to municipalities have been conditional: that is, they have been provided on the express condition that they be spent in particular ways. In effect, these conditions reduce the choice available to local governments in the matter of expenditures, which means that municipal authorities cannot be held accountable for the allocation of a large portion of their budgets.

Local governments have expressed concern about the detrimental effects of the conditional grant system on the accountability and, consequently, on the discipline of Canada's public financing system. Their more immediate concern, however, is the rigidity of the system. In Charlottetown, Alderman George MacDonald told this Commission:

> *Very often the federal [grant] programs are such that we have to start saying, "Here is the money. Start reading all the guidelines and try making up a story to get it" rather than [the Federal government] saying "What are your needs? Can we help you?"*
> (City of Charlottetown, Transcript, Charlottetown, September 19, 1983 [vol. 10], pp. 2468–69.)

While Mr. MacDonald's comments point to the problems of federal-provincial-local relations and to the need for improved communication among all three orders of government, they also indicate the inflexibility that conditional grants, whatever their source, impose on local governments, particularly given the degree of municipal dependency.

There are a number of ways to balance local revenues with local responsibilities and, consequently, to provide more flexibility to local governments and to reduce the need for, and thus the rigidities of, conditional grants. One method transfers certain responsibilities from local to provincial governments. This shift has already been made, in large part, however. In 1913, for example, net expenditures by local governments amounted to almost $14 per capita, while those made by the provinces amounted to $7 per capita. In 1980, by contrast, local expenditures had reached the sum of $696 per capita, while provincial expenditures had multiplied to $2219 per capita.[2] These figures reflect increased provincial responsibility for health, education and welfare, and increased local spending, after the Second World War, for infrastructure and local schools. Provincial governments have also begun to assume responsibility for local school costs. Four provinces now accept virtually complete responsibility for school financing. Because many local responsibilities have already effectively become provincial, however, the possibility of further major transfers of responsibility from local to provincial governments is limited.

To change the structure of local revenues offers more possibilities for correcting the imbalance. The largest portion of local revenues, aside from grants from other levels of government, comes from property taxes. Despite the significant advantages of these taxes, their regressive and relatively inelastic character presents considerable difficulties to local government. For this reason, sales taxes and income taxes are often suggested as means to increase local revenues; but these taxes raise other problems: administration, the taxation of non-residents, inter-urban equity, and great variations in the tax bases among communities.

This Commission believes that it would be preferable for the provinces to dedicate a specific portion of income- or sales-tax revenues for local government financing. We recommend that each province look for appropriate ways to carry out this action. While this arrangement would subject municipalities to some of the vagaries of economic conditions that beset federal and provincial revenues, a designated percentage share of these tax revenues would, in our opinion, enable municipalities to make their own economic assessments of their likely revenues as a basis for long-term planning and budgeting. Local governments would still depend to some extent on provincial grants. Commissioners also recommend that, to the extent possible, provincial governments shift their municipal financing arrangements to provide increased unconditional funding rather than conditional grants.

We believe this arrangement would enable greater flexibility and greater effectiveness in terms of local expenditures, in that local governments are better placed for, and by and large, have greater expertise in, judging what types of expenditures will best meet the community's needs and best take advantage of the unique opportunities it has. This approach is at variance with the one we take to federal-provincial transfers. However, unlike the federal-provincial relationship, in which basic responsibilities are allocated by the Constitution, the provincial-local relationship is determined by a province. That is, provinces have already established the "conditions" for municipal spending of provincial grants by establishing the responsibilities local governments must meet. To add conditions to conditions, we believe, merely increases complexity.

Urban Policy

Although municipal governments are often seen to exercise the power to plan and establish urban policy, their control of planning is, in reality, constitutionally limited and their role primarily reactive. Private property owners and developers initiate development, often working along with senior governments; provincial governments control, review and generally dominate the planning process. Municipal governments can, however, determine the course of development through their decisions on services and infrastructure, such as streets and transit systems. Nevertheless, their dependence on the provinces for financial assistance limits their capacity to initiate and promote development. Municipal capital spending is scrutinized by provincial governments; and most municipal planning and urban-policy decisions are subject to provincial review.

This Commission believes that effective urban planning or policy recognizes that local governments, more than federal or provincial governments, are aware of urban issues and better able to deal with them. We believe that in general, local governments can most effectively establish and carry out urban policy. Therefore, while acknowledging that the provinces have different systems for dealing with urban issues, we recommend that they grant greater and more general authority to local government. Commissioners also believe that a considerable reduction is desirable in the number of special purpose bodies, such as planning boards that are created by the provinces to act independently of local governments. These bodies should consolidate their functions as far as possible so that elected politicians are accountable locally rather than provincially. An increase in local authority depends, of course, on establishing greater, more secure and unconditional sources of financing, and on developing greater federal and provincial sensitivity to local needs and to the local effect of senior-government policies.

The Local Role in Economic Development

This Commission believes that local government, particularly the major cities, will play a significant role in Canada's economic evolution. When deciding whether to move to a particular city or country, companies often look at more than the traditional bases of development, such as location relative to markets, available rail or air transportation, land availability and tax structure. They look also at the safety and cleanliness of a city, the quality of its restaurants and shopping facilities, and the presence of amenities such as parks, art galleries, symphony, opera, theatres, and major league-sports facilities. Canada has many advantages to attract business and investors, and the reputation of our cities is growing. At the same time, however, the attractiveness of a city – its capacity to act as a magnet for able people, particularly those with the scarce skills around which companies, industries and local employment are built – is relative and changing. Canadian urban communities must compete to remain relatively more attractive than other cities throughout the world.

Since we expect economic development to become still more urban, it is vital for provincial and federal governments to recognize that the quality of urban life in Canada is an economic asset of prime importance. The hearings and research of this Commission, however, reveal a build-up of entanglements, irritants, unnecessary restrictions and complications, and undesirable complexities, all of which may dampen the remarkable dynamism that has marked Canadian urban development in the post-war years.

This Commission recommends that each province examine and modify its own municipal government system to provide greater discretion to local governments, to simplify legal, institutional, and constitutional arrangements, and to develop clear and direct lines of communication between local and provincial decision makers. We believe that these changes would allow city governments to exploit fully their capacity to improve economic and social conditions for their citizens, for the provinces, and for Canada as a whole.

Notes

Conclusions and Recommendations

The more government Canadians have, the more democratic we must become. The institutions of responsible parliamentary government remain the key to keeping government our servant rather than seeing it become our master. Commissioners regard Parliament as the principal forum for public debate and intend our recommendations to contribute, in general, to the strengthening of this institution.

To restore Parliament as the principal forum for national debate, we must not only bolster its democratic processes, but we must also improve its capacity to reconcile national and regional interests. We wish neither to reassert the dominance of the national government in line with the prevailing opinion at the time of Confederation, nor to establish the provincial order of government as an integral part of national government.

With regard to federalism and intergovernmental relations, two basic needs influence Commissioners' general objectives. First, it is desirable to clarify where possible, by constitutional amendment, by delegation or intergovernmental agreement, or by more clearly defined policy directions, the responsibilities distributed between federal and provincial governments. Secondly, recognizing the complexity of modern government and the interdependence within our federation, it is desirable to introduce greater certainty and stability into existing intergovernmental processes. We seek neither to eliminate intergovernmental conflict nor to further the development of non-accountable institutions. Rather we seek to secure and give greater public recognition to minimal processes and structures that will moderate the excesses and costs of unresolved conflict and channel creative solutions to common problems.

Commissioners view the Charter of Rights and Freedoms both as a guarantee of specific rights and freedoms of citizens and as an important element of the framework within which Canadian society can evolve. This is consistent with our view that constitutional law should be responsive to social change and evolving values and attitudes, and that it should stabilize the pace and direction of such change.

Responsible Government and Public Accountability

■ The Canadian practice of party government has restricted the opportunities for Members of Parliament to participate in the development of public policy outside the confines of party caucuses. Organized special interest groups now challenge MPs as representatives and frequently bypass them.

- MPs could gain more influence over public policy if members in committee could investigate and debate matters of public interest on which party positions have not yet been established or fully determined. The separation of legislative committees from investigative committees would help to achieve this end by serving to provide Parliament and the government with policy analysis and guidance distinct from that which is received from administrative officials or extra-parliamentary sources.

- Parliament need not diminish the activities of interest groups, but it should provide the principal public forum for these interests to define their concerns. Parliament should encourage these groups to present their positions and demands for an open examination in relation to general interests. There should be a small number of parliamentary committees focusing on comprehensive policy matters – the budget, regulatory policy, Crown corporations, and federal-provincial relations, for example – and these would be ideal forums for such scrutiny.
- Agencies such as the Public Service Commission, the Office of the Commissioner of Official Languages, the Privacy and Information Commissioners and the Office of the Auditor General have important functions, but receive insufficient direction and control from our elected representatives in Parliament. In order to ensure accountability of these agencies, Parliament must define their procedures and basic strategies. Commissioners suggest that the Public Service Commission, the Office of the Commissioner of Official Languages, and the Privacy and Information Commissioners review their work before a Parliamentary Committee on the Public Service. This committee would study the success of these agencies in meeting the various criteria set by Parliament. The same committee, since it would be familiar with the performance of these agencies, should review their financial estimates. The Public Accounts Committee would perform this role in relation to the Office of the Auditor General.
- The federal government has formalized Cabinet structures, processes and support services in recent years, in order to restore ministerial and parliamentary control over an expanded and complex administrative structure. Although central agencies have partially checked the dispersal and diffusion of power to public servants, they can do so effectively only when under the close direction of ministers; otherwise, central agencies themselves become yet another layer of bureaucracy to be controlled.
- We have given too much autonomy and discretion to non-departmental forms of government organization such as Crown corporations and regulatory agencies. Such autonomy has undermined the principles of responsible government. To correct this situation, Commissioners recommend that greater "control" of Crown corporations be defined in the context of a reformed competition and regulatory environment, and not just in the framework of administrative accountability, in accordance with the current trend. Especially for commercial Crown corporations, governments need greater strategic control, not day-to-day interference in management decisions. Moreover, Cabinet

should strengthen its review of regulations formulated by regulatory agencies.

- Although some prominent political appointments have violated the ideal of a neutral public service, it is not true that the senior bureaucracy has become politicized. The system of appointments by Order-in-Council based on professional merit on the recommendation of the Clerk of the Privy Council has worked well. However, political advice to the Prime Minister has traditionally been the basis of appointments to a large number of boards and agencies. This category may be too large; the public might be better served if more of these appointments were based exclusively on merit. An all-party group designated by the proposed Parliamentary Committee on the Public Service should review the current use of Governor-in-Council appointments to boards and agencies, the foreign service, high levels in departments, and Ministers' staffs, in order to help distinguish between two categories of positions: those where partisan sensitivity justifies political appointments, and those where partisan sensitivity is not at issue and where professional merit should prevail. Commissioners' opinion is that this general review process should be continuous, and that appointments of no clear partisan value should be made on a basis of "merit".
- In light of the accelerating challenge to democratic controls presented by the increasing international responsibilities of the state, Commissioners believe it is desirable to provide secure foundations for parliamentary ratification of international treaties and for other measures to ensure parliamentary review of executive action in the international domain. ☐

Representative Government and National Socio-Economic Interests in Economic Policy Formation

It is important to facilitate more direct and continuous involvement of representatives of Canadian interest groups in public decision making, especially in economic policy. Those interests need to interact more with one another and to take greater account of the broader concerns and conflicts within Canadian society for the resolution of which Parliament itself is ultimately responsible.

In comparison with the formal structures that have developed in some Western nations, Canadian consultative practices tend to be fragmented, informal and episodic. Current practices may be inadequate in light of recent Canadian experience and anticipated needs, such as the continuing pressures of economic adjustment. However, we do not recommend a corporatist or tripartite style of government/private sector relations.

■ Although substantial secrecy is necessary in relation to the preparation and release of the budget, Commissioners recommend that guidelines are needed to allow less comprehensive budget secrecy than now exists. We urge the House of Commons to initiate a change in the convention of comprehensive budget secrecy in order to set in motion steps towards more effective advance discussion and consultation arrangements.

It would be desirable to seek federal-provincial agreement on the timing of budgets, so that their presentation could be co-ordinated, with the federal budget either preceding or following most provincial budgets by two or three months. Pre-budget consultation should occur in several forums, but particularly in the House of Commons.

A continuing national dialogue on general directions for economic policy requires a permanent national forum. This Commission favours establishment of a permanent Economic Policy Committee of the House of Commons. The Committee would hold an annual series of pre-budget hearings timed to allow its work to influence budget preparation. It would take testimony about the nation's economic prospects from the Department of Finance, the Bank of Canada, and the Treasury Board, as well as from agencies such as the Economic Council of Canada; it would also gather the views of major groups, including national representatives of business, labour and other associations.

- The Committee would scrutinize the government's performance and the revenue and expenditure implications of the positions of key interests. It should schedule its budget review to co-ordinate with its other responsibilities and with the timing of the annual First Ministers' Conference. Moreover, it would be necessary to adjust the internal priorities and planning cycle of the federal government in light of the accepted federal-provincial cycle.

■ Continuation of sectoral and industry-by-industry dialogue on improving Canada's economy is essential. Discussions should bring together representatives of business and labour, and federal, provincial and municipal governments and other groups, as necessary. Government participation may not always be required. In light of these conclusions, Commissioners recommend that such sectoral discussions be developed within the following guidelines:

- Consultative mechanisms should focus on clear, specific objectives. This approach will make them more likely to be successful.
- Consultation should be a continuing process with reasonably predictable arrangements. Permanent or standing groups may be required in some cases.
- Governments must make a firm commitment to any consultative process they undertake. Effective consultative arrangements require that non-government participants have some influence on the agenda and decision-making schedule. Responsibility for the overall policy-making process, however, rests with the government of the day.

- Consultative processes aimed at consensus building must be supported by fair representation from many groups in society and, normally, by parity between business and labour.
- Sharing and refining of information are prerequisites to these consultative processes. ☐

National Institutions and the Representation of Regional Interests

Commissioners believe that the federal principle requires that the House of Commons, chosen on the basis of representation by population, be balanced by a second chamber based on representation by region. Our institutions should recognize the federal principle, provide greater regional representation, and respond to regional interests in national policy making and administration.

■ Commissioners recommend that the Senate embody the federalist principle and provide the regional representation lacking in the House of Commons.

- A reformed Senate must build on our practice of party government in its elections, caucuses and discipline. The Senate must be elected, and election to the two Houses should take place at the same time.
- In the Senate, representation should be weighted in favour of the less populous regions. All regions need not be considered equal, for the Senate should only temper, not obstruct, representation by population.
- The Senate should be elected by a system of proportional representation. The governing party is more likely to have elected representatives from all regions within its parliamentary caucus, even if, for one or some regions, they secure places only in the Senate. A Senate elected on this basis should ensure that the governing party will usually be able to constitute a Cabinet that includes members from all regions.
- We recommend that Senators be elected in six-member constituencies. This number is large enough to effect the intended proportional representation and yet to allow for some recognition of the regions within provinces. Yukon and the Northwest Territories could elect their Senators on simple plurality. Existing numbers of Senators would be modified and distributed as follows:

	Existing	**Proposed**
British Columbia	6	12
Alberta	6	12
Saskatchewan	6	12
Manitoba	6	12
Ontario	24	24

Quebec	24	24
New Brunswick	10	12
Nova Scotia	10	12
Prince Edward Island	4	6
Newfoundland	6	12
Yukon	1	2
Northwest Territories	1	4
	104	144

- The Senate does not require a veto to temper, on regional grounds, the legislative majority of the House of Commons. Commissioners believe that the Senate should have a six-month suspensive veto, except in relation to legislation with linguistic significance; such legislation would require approval of a majority of francophone Senators, as well as of the Senate as a whole.
- If Senate reform along the lines proposed here is not adopted within a reasonable time, efforts should be made to reform the electoral system of the House of Commons to enhance regional representation. In that event, Commissioners favour the proposal of the Task Force on National Unity to add 60 members to the Commons, distributed to parties on the basis of their share of the national popular vote and allocated to provinces on the basis of the degree to which the parties were "underrepresented" in seats won, or not won, in relation to their share of the popular vote in each province. ☐

Many federal departments and agencies have not assumed responsibility for regional development within their mandates. This failure has lessened the executive branch's capacity to be regionally responsive and has undermined the effectiveness of regional representation in Cabinet.

- This Commission therefore recommends that:
  - The central administrative agencies should be structured so as to provide more regional information upon which the Cabinet can base policy decisions. This requires that regional offices be part of the central agency apparatus supporting the Cabinet and the Prime Minister.
  - The Cabinet should decentralize departments and agencies for purposes of policy planning and development. Sectorally organized departments should incorporate the regional dimension fully in departmental planning and policy development. There should be regional officials in the central administrative decision-making of departments.
  - Regional representation should receive consideration in nominations to the boards of Crown corporations and regulatory agencies. If the Senate becomes an elected body, appointments of the heads of major Crown corporations and

all members of the governing boards of major regulatory agencies should be subject to the approval of a Senate committee to be established for this purpose. □

Barriers within the Canadian Economic Union

Despite recent expressions of concern that the Canadian economic union is becoming increasingly balkanized and fragmented, goods, capital, services and people now move relatively freely within the Canadian common market.

While lost economic output from impediments to free movement and distortions of the common market appears small, private economic actors have indicated that the policies in question create considerable difficulties for them. Even more than the economic rationale, the political rationale for the national right to free movement is a powerful idea for most Canadians.

The effect of these distortions – and the need for effective co-ordination of economic policy – are likely to increase as Canadians face greater competition from the outside world. We should create incentives to international competitiveness, and we should facilitate appropriate adjustments.

The economic union implies elimination of internal barriers and positive measures to facilitate operation of the market, to overcome market imperfections and to pursue effective stabilization, industrial and social policies. All regions must share in the benefits of economic integration.

Internal barriers may be the response of governments to local preferences, and often reflect our commitment to redistribution of income and opportunity. Thus, the challenge, in particular cases, is not simply to eliminate the barriers through constitutional prohibition or other means, but rather, how to balance the economic benefits of free movement against other goals to which Canadians aspire. The trade-offs to be made are not exclusively between economic efficiency and political diversity or provincial autonomy within the federation: Canadian federalism also involves a national community with its own requirements. Moreover, as the Canadian Charter of Rights and Freedoms makes clear, individual rights have implications for the economic union.

The goal of regional development requires that Canadian economic policy must seek not only to maximize aggregate national income, but also to encourage the economic development of individual regions.

■ Commissioners urge that a broad view be taken of the scope of section 121 of the Constitution Act, 1867, consistent with an interpretation that section 121 covers services as well as goods and non-tariff barriers as well as tariffs. However, in light of existing controversy and uncertainty, it may be prudent to seek eventual clarification by constitutional amendment.

- We would recommend a limited amendment to include services to reflect current conceptions of the nature of interprovincial trade. On the issue of non-tariff barriers to trade in goods and services, we recommend as an interim step that governments agree to a Code of Economic Conduct.

- The governments of Canada should develop a Code of Economic Conduct to spell out acceptable practices, set out the principles of the economic union, and provide for enforcement. We advance a series of general guidelines for consideration:
  - The code should confirm general principles of the economic union applicable to both the federal and provincial governments:
    - Reduction of barriers to the allocation of capital, labour, goods and services throughout Canada
    - Non-discrimination against persons (individuals and organizations) based on province of residence
    - Commitment to minimizing the costs of provincial programs that might fall on the residents of other jurisdictions, and to prior consultation for this purpose
    - Recognition of the need for a transportation, communications and information infrastructure to support national economic development with significant regional benefits.
- The burden of demonstrating that a barrier did not violate the principles of the Code should lie with the authority imposing the barrier.
- The Code should identify major areas where reduction of barriers to internal trade should begin. Attention should focus not only on the form of the barriers, but also on the anticipated effects. The possibilities of substitution between types of barriers are extensive, and provinces vary in economic development and in their potential to inflict injury on other jurisdictions or the residents of those jurisdictions. Those drafting the Code might first consider barriers that prevent Canadian enterprises from being internationally competitive.
- Initially governments should set up the Code, and public and governmental pressure should enforce it. The intergovernmental process would provide the appropriate forum for dealing with the politically sensitive issue of internal barriers to trade. After experience with the operation of the Code, we should move to entrench its principles in the Constitution and to enforce the Code through some other form of binding intergovernmental agreement.
- To develop the Code of Economic Conduct, monitor the state of the economic union, and explore methods for co-ordinating policies, the First Ministers' Conference should create a Council of Economic Development Ministers.
- To initiate the process of identifying and controlling internal trade barriers, Commissioners propose the following procedure. The Council will ask each government to list barriers imposed by other governments that they believe harm its provincial economy or its residents. Next, each government would be required to explain and defend those of its policies identified at the first stage. A Federal-Provincial Commission on the

Economic Union would receive this material, and would analyse the barriers, their probable consequences, and the justifications declared. The Commission would identify violations of the principles of the economic union and make recommendations concerning specific terms for the proposed Code. It would send this report to the Council for action.

- A Federal-Provincial Commission on the Economic Union which would serve the Council of Economic Development Ministers would have responsibility for preparing materials for the Council as directed:
  - Analysing the first round of barriers identified by the Council's initial inquiry
  - Initiating research on the state of the economic union and methods for improving it
  - Receiving complaints from groups, individuals and corporations affected by government actions threatening the economic union, investigating them, and reporting on them, with recommendations, to the public and the Council.

If a Code is eventually made legally enforceable, the Commission could become a regulatory agency, but one that regulates governments. □

Economic Management

In several specific areas related to our concern with the international environment, the Canadian economic union, and economic adjustment, Commissioners believe that constitutional changes are desirable for more effective economic management; Canada requires a procedure which would allow treaties, once concluded, to be binding and enforceable on both federal and provincial authorities within Canada.

■ We recommend a constitutional amendment to provide that where a proposed treaty contains provisions that require implementation by provincial legislatures or affect rights within areas of provincial jurisdiction, the relevant sections should be ratified by provincial legislatures. We propose the application of the amendment formula for this purpose so that sections of a treaty imposing obligations on provinces would come into effect on the passage of resolutions in the legislatures of two-thirds of the provinces, representing at least half of Canada's population. We do not see this recommendation as having immediate application to negotiations with the United States on a free-trade agreement. We would recommend, however, that a constitutional solution be in place before the proposed trade agreement would come up for review in the 1990s.

■ To clarify jurisdiction and roles in the field of telecommunications, we recommend concurrent jurisdiction with federal paramountcy.

■ To clarify responsibility regarding certain aspects of overall regulation of trade and commerce, we propose that section 91(2) be amended to provide explicitly for federal regulatory power over competition and product standards.

■ If intergovernmental agreement is not reached soon on the harmonization of regulations respecting interprovincial trucking, we recommend that serious consideration should be given to bringing this matter under federal jurisdiction. ☐

Equalization

The principle of equalization, an essential element of Canadian federalism, represents a commitment to all provinces that economic misfortune will not undercut their constitutional role. It contributes to a true decentralization of government functions, in spite of the differing economic capacities among provinces.

Commissioners stress the distinction between equalization payments and regional development programs. The former are intended to offset economic disadvantages, while the latter are intended to reverse this disadvantage. Equalization payments are necessary only because of our lack of success in combatting regional economic disparities. In practice, this means that regional development financing must be added to equalization disbursements; the federal government should not cut one in favour of the other.

■ The federal government's responsibility for interregional redistribution gives it a leading role in designing and operating the equalization scheme. Commissioners recommend that the following changes to the equalization system be discussed with the provinces:

- Canada should return to a representative tax system that includes all 10 provinces in the base. The present five-province calculation base allows too much room for distortion, strategic behaviour and unintended side-effects.
- Equalization payments should include some portion of resource revenues. There is no magic figure here, but the 20 to 30 per cent range seems an appropriate compromise, since it approximates the amounts that would accrue to provincial treasuries in the form of tax revenues if natural resources were in private hands.
- The concept of including needs as part of the entitlements calculation is attractive. Commissioners recognize, however, that this can develop only slowly, given the amount of data required and the serious practical difficulties involved. The inclusion of needs in the calculation will be especially important if the Northern territories enter the scheme. ☐

Regional Development

This Commission believes that regional development must remain an essential component of Canadian policy and, indeed, of the Confederation bargain as now reflected in section 36 of the Constitution Act, 1982. It must be recognized, however, that policies intended to promote regional development have often hindered the overall efficiency of the national economy in that they impeded inter-regional adjustment and distorted regional development. Canadians need to reconsider the way in which we look at regional economic disparity, what we do to overcome it, and the institutional mechanisms we bring to the task.

■ We recommend a new federal-provincial system of sharing regional development expenditures and responsibilities.

- The federal government should direct regional development programs toward improving regional productivity and the efficiency of the labour market. To these ends, such programs should include measures to improve worker and management skills, enhance research and development efforts, ensure a high level of infrastructural support, and supply assistance for intra- and inter-regional mobility. The federal government should not only provide such programs on a national basis, but should also make a special effort in the less developed provinces. While it might make sense, too, for the federal government to provide assistance for plant modernization as a means to enhance regional productivity, we believe that it should provide this type of assistance on a national basis, if at all, or that the provincial governments should take on this responsibility on a regional basis.
- Under this arrangement, the federal government would end all explicit and direct regional employment-creation programs. While national schemes would continue, federal subsidies, tax breaks, and so on, intended only to generate jobs in, or attract firms to, a particular locale, would be eliminated. Similarly, the federal government would terminate regionally differentiated unemployment-insurance programs, tax credits, and other measures that tend to distort regional labour markets. Funds formerly allocated to these types of programs would instead become the source of Regional Economic Development Grants.
- Provinces that qualify for equalization payments would be eligible for Regional Economic Development Grants. The amounts of the grants would be determined by a formula on a per capita basis, and they would be proportionate to the degree of fiscal disparity identified by the equalization formula. As noted earlier, equalization payments are necessary to offset economic disparities, while the purpose of these new grants would be to reduce future disparities. They would be renegotiated every five years.

- Provinces would assume full responsibility for local or place-specific employment measures as part of their own approach to regional development. They would be free to use the Regional Economic Development Grants for this purpose, subject only to two conditions:
  - Each recipient province would sign an Economic and Regional Development Agreement (ERDA) with the federal government, which would set out a broad economic development plan for the province (and for each other province) and would indicate the measures to be carried out by both orders of government. Some elements of these packages might take the form of shared-cost programs or federal contributions to provincial activities; in general, however, Commissioners recommend that under the ERDA umbrella, each government remain responsible for the implementation and delivery of its own programs, in order to enhance accountability.
  - The recipient province would be required to sign the proposed Code of Economic Conduct to improve the functioning of the Canadian economic union.
- While recognizing the immediate need for financial prudence at the federal level, Commissioners believe that the total federal financial commitment to regional development – combining the Regional Economic Development Grants and other funds spent through ERDAs – should increase significantly over the next few years.
- The federal government would continue to play an important role in other development efforts which have significant regional impacts such as:
  - A reformed equalization system
  - The proposed Universal Income Security Program and the Transitional Adjustment Assistance Program
  - Sectoral policies, such as those pertaining to fisheries, agriculture, and forestry. These should be designed according to criteria for good sectoral policy (see Parts III and IV of this Report) but they ought to also be developed in close consultation with provincial governments where these are affected to an important degree.
- A sustained federal commitment to regional development requires that a single central agency be responsible for injecting regional concerns into the programs of individual federal departments, and for co-ordinating federal efforts. It would appear to Commissioners that the Federal-Provincial Relations Office (FPRO) reporting to the Prime Minister, would be the appropriate existing body. We believe also that the Federal Economic Development Co-ordinator (FEDC) or other senior officials resident in each province could help to co-ordinate federal activities within each province, interacting with the provincial government and establishing links with local

economic interests. The federal government should enlarge the responsibilities of such federal regional officials, who should report directly to FPRO. ☐

Fiscal Arrangements

Tax Collection Agreements

The Tax Collection Agreements have served Canada well. They are convenient for both citizens and governments, and they help to maintain harmony and contribute to the strength of the economic union. They should be retained. Nevertheless, the agreements are presently under considerable strain, and are in some danger of disintegrating. This Commission's proposed reforms are based on the desire to maintain the agreements, but not at an excessive cost either in terms of the accountability of legislatures or in terms of the flexibility which exists in the system.

■ Commissioners therefore recommend that:

- The agreements be amended to place the personal income tax on the same footing as the corporate tax, applying the provincial rates to the common, federally determined base. This measure would not only reduce provincial vulnerability to federal tax changes, but would also enhance provincial autonomy, since it would become easier for provinces to decide how progressive their own tax rates should be.
- The federal government consult with provinces before introducing any tax change which would have a significant effect on the federal-provincial relationship. This recommendation is consistent with Commissioners' larger concern to reduce budget secrecy for federal and provincial governments and to ensure that federal budget proposals receive wide discussion in Parliament.
- To provide greater consultation on taxation matters of a more fundamental nature, Commissioners recommend that a new federal-provincial Tax Structure Committee be given the following mandate:
  - As part of the regular process of the quinquennial review of federal-provincial fiscal arrangements, the Tax Structure Committee would re-examine the definitions of taxable income, basic exemptions, marginal tax rates, and the like. This is really an endorsement and extension of a consultation process which is already in effect. The Tax Structure Committee would also monitor the division of tax room between the two orders of government, in light of anticipated revenue and expenditure needs, and of the difficulties of managing restraint.

- As part of the overall concern for the economic union, the Tax Structure Committee could also discuss the implications of federal or provincial tax credits and subsidies. It would thus assist the Council of Economic Development Ministers which, we propose, be responsible for the development of an overall intergovernmental Code of Economic Conduct. This Committee would be composed of representatives of all governments, including those now outside the agreements. ☐

The Spending Power and the Impact of Fiscal Restraint on Intergovernmental Transfers

Although Commissioners do not recommend formal limitations on the spending power, we consider that this power has important consequences for federalism and therefore should be exercised with special restraint and subject to certain guidelines concerning its use.

■ Commissioners thus recommend that the spending power be retained as a vital instrument for flexible responses to changing definitions of the national interest, subject to the conditions that:

- The judicial distinction between federal legislation providing grants or gifts and federal legislation involving direct regulation in fields of provincial jurisdiction is appropriate and should be further refined.
- As a matter of principle within the federation and for purposes of accountability and clarity of roles, the federal government regard new shared-cost programs as a last resort in pursuing its objectives.
- The use of the federal spending power in areas of provincial jurisdiction be supported by broad national consensus. In addition to the contribution to consensus which an elected Senate with stronger regional representation will make, consultation through the Federal-Provincial Ministerial Councils and, ultimately, the First Ministers' Conference is essential, not only in relation to new programs, where it will occur in any case, but also in relation to the proposed alteration or termination of a program by the federal government. Designated periods of operation of, say, five years, could be considered for program renegotiation.
- In order to retain a desirable degree of federal flexibility and accountability to Parliament while assuring provinces some stability for planning and protection against rapid unexpected variations in federal spending, we recommend that:
  - Federal-provincial transfers be subject to a review on a five-year basis.
  - During that period, the federal power to make adjustments be limited to, say, 5 per cent in any given year, without provincial approval. ☐

Intergovernmental Relations and the Institutions of the Federation

The intense intergovernmental conflict Canada experienced in the 1970s may be partly attributed to institutional limitations. Interdependence in modern federalism is inescapable and needs to be managed, as do the excesses of intergovernmental competition.

This Commission's goal is to encourage a more functional approach to federalism, one not oriented towards centralization/decentralization, but one which emphasizes the potential contribution of Canada's federal arrangements to the well-being of Canadians. Canadians should create political institutions to co-ordinate activities involving both orders of government.

While greater co-ordination of federal-provincial affairs would be desirable, Commissioners believe that the diversity of government action inherent in a federal state is also a positive contribution to society. Thus we have tried to strike a balance between encouraging institutional diversity or competition and proposing new measures of federal-provincial co-ordination.

■ Commissioners do not recommend comprehensive constitutional amendment as a means to modernize the division of powers. Instead, we urge the use of more flexible instruments to clarify or transfer the location of responsibility. To this end, we recommend that:

- The power of intergovernmental delegation be expanded so that, on a particular matter, law-making authority could be delegated to another jurisdiction. Such delegations should be approved by the legislatures of all jurisdictions involved
- Constitutional amendment be used to establish a procedure that would permit the Parliament of Canada and provincial legislatures to enter into intergovernmental agreements that would be binding on their successors
- The powers of reservation and disallowance, now by convention virtually "dead letters", be formally interred by means of an appropriate constitutional amendment.

■ To provide essential recognition of the need to manage intergovernmental interdependence, and the need to co-ordinate policies and activities, the First Ministers Conference should be established in the Constitution with the requirement that it meet at least once each year. Such an institution must in no way encroach on the principles of responsible government.

■ First Ministers may eventually wish to consider the creation of a body comparable to the Advisory Commissions on Intergovernmental Relations in the United States and in Australia. "Third parties" of this nature may facilitate behind-the-scenes resolution of intergovernmental conflicts and contribute to improving the context of information, analysis and public opinion to which the intergovernmental process will need to respond.

■ Despite a plethora of federal-provincial bodies, current intergovernmental discussions are sporadic and lack co-ordination. Our purpose is to suggest a core framework of federal-provincial mechanisms which, in a more streamlined way, would support the First Ministers in their collective and individual responsibilities. Commissioners propose that the First Ministers' Conference appoint a network of Councils of Ministers to serve in major functional policy areas and to be supported by continuing committees of officials. We believe that three central Ministerial Councils should be established in the fields of Finance, Economic Development, and Social Policy. We therefore recommend that:

- **The *Council of Finance and Treasury Ministers* which now exists and meets from time to time regarding fiscal arrangements, economic projections, and macro-economic policy be formalized to encourage greater regularity of assembly, better co-ordination of budgetary preparations, and to receive the findings of the new Tax Structure Committee, which would monitor tax developments**
- **The *Council for Economic Development* seek agreement on common objectives in economic development and trade policies and identify opportunities for mutually beneficial links among regions. The Council would be responsible for monitoring and assessing the state of the economic union and would serve as the vehicle through which to develop a "Code of Economic Conduct".**
- **The Ministerial *Council on Social Policy* consider all facets of social policy, especially in the fields covered by Established Programs Financing and the Canada Assistance Plan. Consultation with practicing professionals and interested groups and individuals is particularly important in this area. We would encourage Parliamentary Committees to play a stronger role in this activity.**
- **To ensure that governments are held accountable for their conduct of intergovernmental affairs, Commissioners recommend that Parliament and the provincial legislatures should establish permanent standing committees responsible for Intergovernmental Relations. □**

Differing provincial regulations create inconvenience for those who wish to operate nationally. The impetus for interprovincial efforts towards harmonization must arise through the pressure of groups adversely affected by interjurisdictional variations. Commissioners therefore propose no specific institutional changes designed to enhance harmonization of provincial laws.

The Charter of Rights and Freedoms

The Charter and Constitutional Government in Canada

The Charter of Rights and Freedoms signals a significant transformation of the relationship between citizens and the state in Canada. Most noteworthy are the important limitations imposed on the constitutional authority of legislatures and the elevated role of the judiciary as guardians of the constitutional rights and freedoms of individuals. The Charter will also further the rights of citizens to review and assess government actions, and it will contribute to a fuller and more regular discussion of citizen rights in Parliament. Its guarantees will probably become the basis for individuals and groups to introduce issues to the national and provincial political agendas.

The scope and application of the Charter will be tested constantly through both the legal and political processes. The Charter is not, however, a springboard for unlimited claims of citizen rights, for there are reasonable limits to its guarantees. Ultimately, its effectiveness in protecting the rights and freedoms of citizens and in enhancing democracy will be determined by the way in which citizens use this document.

■ This Commission believes that the changes recorded and introduced by the Charter should be given a broad scope in interpretation and application. Departures from its guarantees should meet stringent tests and conditions, justifying the circumstances of exception.

■ The Charter's general override provision should contribute to public awareness of legislation limiting the constitutional rights of citizens in Canada. Overriding legislation should include a declaration of intent to legislate, notwithstanding a provision of the Charter, and should include not only reference to the specific rights being overridden, but also an indication of the purpose of such legislative action. Such a statement of purpose would help the courts to ensure that limitations do not exceed what is necessary to achieve their objective; it could also be a useful reference point in discussions on whether to extend the override after the five-year period.

■ Commissioners do not suggest constitutional amendments to change and improve upon the Charter's words. Rather we consider various interpretations of the Charter which we think will serve to maximize the desirable impact it can have on Canadian society. Two examples illustrate our approach:

- We favour a broad and flexible application of the Charter at the periphery of government activity, as well as in its more visible legislative forms.
- Similarly, in the matter of the Charter's guarantees of personal mobility rights, we conclude that preferential provincial employment schemes permissible under the Charter should be

strictly limited to the socially and economically disadvantaged within a province. Such programs should not preclude the federal government from simultaneously pursuing employment-opportunities programs in that province. ☐

Inherent in the Charter of Rights and Freedoms is an attempt to overcome some of the problems of national unity that have pre-occupied Canadians since the mid-1960s. This is especially evident in the Charter's provisions respecting mobility rights, official languages and minority official-language education, as well as multiculturalism.

With regard to ethnic diversity in Canada, Commissioners believe that multiculturalism policy should seek to create circumstances that permit all Canadians to preserve and enhance their cultural heritage within the broader Canadian tradition of individual equality. Multiculturalism is not a justification for cultural or racial discrimination. For visible minorities, in particular, racism must be addressed through more than multicultural policy. There is a systemic aspect to racial discrimination in Canada. As with other pattterns of systemic discrimination affecting groups such as women, the handicapped and other identifiable groups, the Charter plays an important role as both an educative and legal instrument in enhancing equality.

The Charter's equality-rights guarantees embody a broad definition and understanding of equality. These guarantees reflect contemporary notions of substantive equality in giving assurance of equal benefit of the law and equality under the law. By enabling affirmative action programs, the Charter responds to contemporary concerns about discrimination against various groups in society.

■ Commissioners believe that governments have a leadership role to play in breaking down these patterns of discrimination and we believe, too, that affirmative action is a valuable tool for this purpose. Accordingly, we view the provision in the Charter enabling governments to pursue affirmative action programs as a valuable reinforcement of government's role. Equality, however, must ultimately relate to individuals, and affirmative action must be supplemented with other programs designed with individual equality as the ultimate goal.

■ The Charter both contains guarantees of individual equality and elsewhere recognizes special rights of various groups, such as official-language minorities and Canadian aboriginals. We believe that when group rights are inconsistent with rights of individual equality, the latter, as a general rule, should prevail. ☐

The Supreme Court of Canada

The members of the Supreme Court of Canada do not perform representative functions in the Canadian institutional and constitutional system. Judicial merit alone is the criterion by which the Court's membership and performance should be assessed. Accordingly, Commissioners reject arguments that the composition of the Supreme Court should be regionally representative.

Existing provision in the Supreme Court Act for the appointment of Quebec members is based on the distinctive legal traditions of that province. We also reject socio-economic representational claims about Supreme Court of Canada membership, which we anticipate may emerge as the Court addresses complex Charter litigation involving citizen-state relations.

The central issue in the appointments process is the perception that it does not adequately involve the constituencies ultimately affected by Supreme Court decisions. Although the existing informal procedures followed by the Prime Minister before making appointments to the Supreme Court do involve extensive discussions, they are sometimes perceived as not taking sufficient account of concerned interests or advice. Measures to shift responsibility from the Prime Minister to some designated group or institution necessarily involve replacing one political process with another. If a broadly based political process of consultation is to be replaced by alternative arrangements, an elected Senate has much to commend it.

■ The constitutional status of the Supreme Court and, in particular, the independence of the Court, should be clarified by entrenchment, although there is no reason to remove responsibility for the administration of the Court from the federal government.☐

Quebec

The Distinctive Character of Quebec Society

Quebec is characterized by the presence within its borders of a largely francophone population which controls and gives direction to its own political and social institutions. The existence of this institutional framework which re-enforces the distinction between the majority status of francophones within Quebec and the position of francophones elsewhere in Canada is central to *la spécificité du Québec*. The very essence of Quebec society lies in the fact that it is the principal, though not the exclusive, focus for the political dimensions of French life in Canada. To a large extent, Quebec remains a linguistically isolated society, an island of French in an overwhelmingly anglophone sea. For Quebec and for francophones outside the province, the central challenge will always be how to remain French in North America.

This challenge entails practical problems in the cultural and economic domains for whose resolution Quebecers and francophones outside Quebec, individually and collectively, are, themselves, ultimately responsible. But constitutional recognition of Quebec's distinctiveness and of Canada's duality would provide an affirmation that answers to the practical economic and cultural problems of French life can be pursued within the Canadian context and with the support of the rest of Canada. The necessary compromises could thus be worked out in a clearly understood context of recognition and affirmation of a cultural complementarity which is at the very heart of the Canadian experience.

■ The initial requirement at the level of principle to secure a renewed understanding between Quebec and the rest of Canada is

a statement in the preamble to the Constitution along the following lines:

> *Recognizing the distinctive character of Quebec as the principal, though not the exclusive, centre for Canadian francophones and accepting as fundamental the duality of the Canadian federation . . .*

Fundamental Guarantees

As a consequence of Quebec's uniqueness, steps should be taken to ensure that no future constitutional amendment as noted below be imposed on Quebec which that province might consider to affect its fundamental interests as a distinct society:

- Concerning transfers of legislative powers from the provinces to Parliament, the simplest means to provide Quebec with the necessary protection, without putting the principle of equality of the provinces in question is to grant each province the right to opt out of any general arrangement with full compensation in all cases.
- In relation to reforms of national institutions which are not covered in the present opting-out formula, the only means to protect the interests of Quebec is through the right of veto. An obvious solution would be to grant all provinces such right in conformity with the equality principle. In the long run, this move could, however, freeze the natural development of our national institutions. Although granting Quebec the right of veto is an arrangement politically more difficult to obtain, it is closer to the intended objective, for it is the distinctive character of Quebec society for which protection is sought. It is important that Quebec have a right of veto on any amendment to the institutions described in section 42(1) of the Constitution Act, 1982, if such an amendment touches on the special character of Quebec and the duality of Canada. One method of implementing such veto would be to amend immediately section 47 of the Constitution Act, 1982, in order to grant French-speaking Senators the right to block proposed amendments affecting Quebec under the double-majority formula described below.

The Senate and Quebec

- With regard to federal legislation, any proposed bill with linguistic implications, before becoming law, should require a double majority of the Senate: that is, the approval of a majority of all Senators and of a majority of francophone Senators. Such veto would be a full rather than a suspensive veto. In light of the protection offered by this double-majority proposal, Commissioners see no need for specific guarantees to Quebec of a certain proportion of seats in the House of Commons.

Division of Powers

- Because of Quebec's distinctiveness, the most obvious fields where conflicts may arise between that province and the federal government are education, external relations, immigration, communications and culture. There are ways in which Quebec could participate in dealing with these areas. While we make no recommendations, we do suggest that legal mechanisms such as delegation and inter-governmental agreements may provide a better means of accommodating the specific interests of Quebec than would constitutional amendment.

Francophones Outside Quebec

- The diverse communities of Francophones in Canada outside Quebec are currently in a state of crisis. If they are to survive and flourish, prompt action is required. Commissioners suggest that beyond recognizing the principle of duality in the Preamble, governments should make efforts to extend the recognition of French and English as the official languages of individual provinces. Ontario in particular, with its large French-speaking population, should proceed promptly to implement official bilingualism. Such a step would set an example for other provinces.
- Scattered French-language communities outside of Quebec face difficulties in developing a French-language working environment. Efforts to solve this problem should be geared towards the development of French-language centres of activity. These centres would vary from province to province, depending on the population and geographic concentration of francophone Canadians. In some areas, the centres would be of an essentially cultural or educational nature, and in other areas, such as in New Brunswick, they could include a strong economic component.
- Furthermore, this Commission wishes to point out that implementation of language rights has not kept up with the intended policy of bilingualism. We believe that litigation, while generally useful, is not the proper tool for making improvements in this direction, since it is a lengthy and costly method of dealing with these problems.
- Instead, we recommend that stronger support be given to the role of the Commissioner of Official Languages. □

Aboriginal Self-Government

Measures to increase the influence and control exercised by aboriginal people over their social and economic affairs are desirable. Our commitment to this objective is based on the distinctive place of aboriginals in Canadian society as the first peoples of Canada and on the constitutional recognition they now enjoy.

Institutional reforms to enhance the autonomy of aboriginal peoples focus on the idea of self-government. Implications of aboriginal self-government for Canada's overall institutional framework and, in particular, for the three pillars of the Canadian constitutional order, Parliament, federalism and the Charter, have not yet been clarified. Indeed, many important issues have been avoided and should be addressed more squarely. The fundamental changes to our national and provincial institutions that are now being contemplated need broad Canadian understanding if they are to be acceptable in the long run. The pace of discussions, as well as the comprehensiveness of debates in Parliament and the legislatures should reflect this concern.

The Northern Territories

The economic, social and environmental challenges of development in Northern Canada will remain of continuing concern to Canadians. From an institutional perspective, significant questions must be addressed – some of these in the near future.

- No Canadians – Natives and non-Natives, Northerners and Southerners – can be well served by further delays in the settlement of aboriginal land claims. Final agreements affirming and delimiting aboriginal rights should be actively encouraged. If necessary, deadlines should be established by the parties, and discussions could proceed without reference to the issues of legislative powers, sovereignty and special political status, which could be dealt with subsequently in other settings.
- The Yukon Act and the Northwest Territories Act should be amended to reflect the current practices of responsible government in Yukon and to encourage comparable evolution in the Northwest Territories. In both territories, new formula-based financial arrangements should be negotiated, to increase the predictability of transfers and to promote genuine responsibility and accountability for expenditures.
- On the basis of federal commitment to the ultimate goal of some form of provincehood in the Northern territories, the governments involved should establish a timetable for the transfer of provincial-type responsibilities in areas such as health, labour relations, inland waters, renewable resources and the institution of criminal proceedings. Additional measures should be taken to:
  - Advance the process of transferring to territorial governments responsibilities for Crown lands that do not bear directly on the national interest and that have not been ceded to the Native people through claims settlements

- Institute resource-revenue/sharing arrangements comparable to the types of agreements worked out with Nova Scotia and Newfoundland
- Confirm participation of the territorial governments in federal-provincial forums where matters of direct concern to Northern residents are being discussed. Joint-management arrangements may be valuable transitional procedures.

■ Failing an internally generated and ratified agreement on division of the Northwest Territories, the federal government should establish an independent boundary commission to recommend a boundary on the basis of arguments from the two constitutional forums. Subject to the spirit of the Canadian constitutional tradition and the need to recognize the essential quality of Canadian citizenship, the structure of post-division government should be left to the discretion of the respective constitutional forums. □

Municipalities

Local governments are an enduring and important feature of government in Canada, despite their lack of constitutional status. Variations in approaches to local government in different provinces have permitted sensitivity, dynamism and creativity in the city-province relationship. Existing arrangements have contributed to the development of some of the most liveable cities in the world. Local governments have experienced uncertainty and frustration because of limited policy-making instruments and their relations with provincial and federal governments, but responses to current concerns must begin from the premise that we have been doing something right. Canada's major cities should be provided with the legal, financial and institutional means to fulfill their economic development role. By and large, this involves removing constraints that prevent their involvement in development.

■ Although Commissioners do not recommend changing the constitutional status of local governments, the federal and provincial governments should increase the involvement and responsibility of local authorities. The federal government should review with the provinces the possibility of occasional tri-level conferences; improve communications between municipalities and ministers whose responsibilities affect local interests; assign responsibility to investigate the significance of local concerns in national policy to the proposed Standing Committee for Intergovernmental Relations; and explore opportunities for the decentralization of specific responsibilities, including airports and federal urban properties to federally-appointed local agencies. The use of the delegation amendment, as Commissioners have earlier proposed, may become a means to delegate directly to local governments responsibility for such questions as siting, development and administration of some airports through agreement with the relevant province.

■ The provincial governments should continue to assess possibilities for assuming financial responsibility for requirements greatly exceeding local revenue sources. Commissioners also recommend that the provinces examine ways to designate a specific portion of income or sales-tax revenues for local government financing. Commissioners believe that revenues to local governments should be increasingly unconditional. □

COMPENDIUM OF CONCLUSIONS AND RECOMMENDATIONS

For the convenience of the reader, the "Conclusions and Recommendations" from each part of this Report are collected here.

PART I

Global Outlook

Conclusions and Recommendations

As we peer into the future, there is only one central fact about which we can be reasonably certain: there are powerful forces loose around the globe that will profoundly affect the lives of all of us here in Canada. The global outlook is full of danger signals; a majority of the world's citizens are facing very troubled prospects.

Commissioners have noted two very distinct trends in world affairs which are disturbing when viewed together. The world today has become more interdependent in economic, social and technological matters. We all share problems and opportunities as global citizens. However, the political will and international institutional machinery have not kept pace with this growing interdependence. While Commissioners are not alarmed by this divergence, we are concerned that it be recognized, and that steps be taken to rebalance altruism and self-interest on the international stage.

In entering what may well be a very turbulent period, Canadians occupy a privileged position that may make the prospective problems of the global community appear quite remote. We enjoy a comparatively high standard of living; we possess abundant natural and human resources; and we have in place a political fabric and institutions that up to now have proved themselves reasonably capable of providing the framework of laws and regulations, policies and programs required to serve our national interest best.

But "no man is an island, entire of itself", as John Donne astutely observed more than three and a half centuries ago. As Commissioners noted at the outset, Canada is more exposed than most nations to developments taking place in the world, because of far-reaching links of trade, aid and diplomacy. Canadians are highly vulnerable to adverse impacts, both direct and indirect, but we are also in a favoured position, in many ways, to seize opportunities as they arise.

In addition, however, the very breadth and depth of Canada's involvement in affairs around the world appear to impose upon Canadians a special responsibility to take up the important role that may be available to us: to contribute to a resolution of some of the more critical global problems that will arise in the years ahead. This view is based on Commissioners' deep belief that the major problems facing the global community are rooted in social, political and institutional structures, values and norms. In part, Canada's contribution might be made in material forms and by way of education, training and technology. Conceivably, however, we could play an even more important role as a catalyst, in bringing other nations together to work in concert for the resolution of global challenges and problems.

As Commissioners stressed at the beginning of this section, and as we reiterate now, we can at best perceive only dimly how the future will unfold. Undoubtedly, many current projections of prospective developments and their likely consequences will prove wrong in degree or in kind. It is crucially important, however, that Canadians should carefully search out the primary forces in play around the world, constantly monitor their action and interaction, and stand ready to respond, as circumstances require, either alone or in combination with other nations. While many future developments abroad will certainly have a direct impact on our nation, in many instances we may well have greater cause for concern about the indirect consequences for us of global impacts on other countries.

This Commission underlines the importance of recognizing five critical features of the global system:

- The degree of interdependence will continue to increase in the foreseeable future, causing the domestic policies of any one country to be significantly affected and, in some instances, dominated by global forces and the policies of larger countries.
- While the eradication of poverty and famine is within the grasp of most developed nations and certainly of Canada, it is not even on the horizon for most of the world's peoples.
- The dangers and challenges identified in the physical, economic and political global environment are so significant that the general increase in well-being of all dwellers on the planet is at risk.
- The principal limits to growth are not physical, but political, social and institutional. The major challenge thus lies in the fruit of technological and institutional ingenuity.
- Global interdependence demands that decisions be based on long-term goals and be made in the broadest possible context.

■ In view of this assessment of the global environment, Commissioners urge that the fundamental global priority within the context of peaceful co-existence become the general increase of the well-being of all nations and peoples, and the urgent eradication of malnutrition and starvation.

- **Given the high degree of global uncertainty that this Commission has identified, it is important that Canadians understand both the privileged position we occupy on this planet and the** human imperative this places on Canada to provide leadership in those areas of critical concern to the world, where our nation has a capacity to provide that leadership. Commissioners recommend that as a matter of high priority, Canada pursue a more activist foreign policy based on the concept that Canada now occupies a more responsible position as one of the principal powers. Combining humanitarian and pragmatic interests, Canada should:

- Seek to broaden Canadian and world understanding of the meaning of interdependence and the threats and opportunities which confront civilization. This approach includes giving higher priority to issues relating to the natural environment and especially to the implications for global well-being of the continuing population explosion.
- Vigorously support reform of the multilateral system represented by the United Nations and its specialized agencies to bring the institutional machinery into line with the substantive problems and opportunities of the future.
- Pursue bilateral and regional initiatives where these are appropriate and essentially outward-looking in a multilateral context.

■ This Commission has reviewed the broad sweep of global interdependence in an effort to identify those areas where Canadians will be offered both challenges and opportunities over the next quarter century. We Canadians must take account of this interdependence in designing our own national policies. In particular, Commissioners recommend that:

- In the decades ahead, Canada's policy makers integrate environmental decisions with those on economic development. This policy will be essential, for there is, in this Commission's view, no ultimate trade-off between economic development and the preservation and enhancement of a healthy environment and a sustainable resource base.
- Canadian economic policies be developed increasingly in a global context. This process requires a fuller recognition of the long-term and structural changes evolving, particularly in the areas of trade, technology and the role of governments, in the struggle for competitiveness. The incentives for work effort and productive contribution should be enhanced in a more flexible market environment.
- Canadian social support mechanisms and programs be designed more efficiently to accomplish the feasible task of removing the blight of poverty within Canada and to establish our national economy on a flexible, but secure, social infrastructure
- Parliament be reinforced as the principal forum for national debate and reconciliation of international, national and regional interests. ☐

PART II

Canadian Opportunities in an Open World

Conclusions and Recommendations

The global environment presents Canada with enormous challenges and opportunities. Rapid growth of imports from the developing countries, a changing trade-policy environment and domestic pressures on our trading partners for new protection imperil Canadian jobs. By contrast, growth and technical progress abroad offer us new export opportunities and chances to benefit from access to cheaper and higher-quality products than we can produce. As Commissioners noted at the beginning of this Part, the challenge is one of change, adaptation and adjustment; the opportunities may be unlimited. In light of these developments, however, the choices Canadians must make are difficult.

We Commissioners have been frequently reminded, in the course of our task, that Canada's domestic economy is largely defined by its relationship to the wider global economic system. Canada's last Royal Commission on our economic prospects captured this point:

> *Something of Canada's essence is defined by its external relations. Much of its economic structure can be explained only in terms of its external trade . . .*
>
> *The ships loading lumber on Vancouver Island or aluminum ingots on the Saguenay are reminders of how deeply our material well-being is involved in the prosperity of other countries, even outside the boundaries of North America.*[1]

Canada's economic development, then, as well as our government's economic development policies, are significantly affected by conditions beyond our borders. As a relatively small, "open" economy, Canada is particularly vulnerable to outside influences on its trade and economic performance. In order to foster stability and predictability in some of these external forces, successive Canadian governments have sought to develop formal rules for conducting relationships with our trading partners. The pursuit of this objective has always involved an essential problem: How are we to reconcile conflicting priorities among national objectives and the requirements of a stable international economic system? To resolve inherent conflicts has required a continual process of negotiation and compromise at both the domestic and the international level. Governments have often had to adjust and put to positive use the constant tension between the forces of economic protection and trade liberalization.

For almost forty years, Canada has pursued a largely multilateral approach to its foreign economic policy; indeed we have been one of the strongest supporters of the multilateral system centred on the GATT and the International Monetary Fund. This approach was the most effective way to improve and secure access for our products and to instil order, stability and predictability into that process. Even on the import side, we have found that we must negotiate multilaterally to open our own market, in exchange for access to foreign markets. This action has proved a useful tool of industrial policy and has allowed for orderly adjustment of the economy through foreign competition.

To a great extent, Canadian trade policy has been, and will continue to be, developed as a trade-off between the business objective of securing improved access to foreign markets, the economic need to promote efficiency and competitiveness in the domestic economy, and the political need to maintain our sovereignty and freedom of action. The international trade and payments system largely determines the design and use of particular policy instruments. For Canadian producers and investors, there are several tests of this international system. Can our government successfully improve market access for those sectors where Canadian production is, or can be, competitive in world markets? Will it maintain current access available to Canadian producers? Will it protect producers from unfair or injurious foreign competition? Because private sector investment is necessary for growth and job creation, Canadian producers need to be confident that their access is secure, and that foreign governments will not move to frustrate the efforts to market Canadian goods abroad.

The multilateral system of rules is intended to facilitate decisions favouring adjustment and to penalize decisions favouring protection, but it needs political will to make it work. Between 1973 and 1979, the Tokyo Round of trade negotiations provided a framework for organizing political will. The negotiators sought to reduce trade barriers and to move the ongoing management of trade relations in the direction of freer trade. For the past six years, however, there has been no such framework.

A new round of GATT negotiations may be initiated, to concentrate on elaborating world trade law and removing remaining barriers to world trade, and to provide a basis for organizing political will to resist protection. The results of a future GATT negotiation are not certain, however, nor are they just around the corner. A new round of negotiations requires complex co-ordination and revolves largely around the interests of three or four players: the United States, the European Community, the less-developed countries (LDCs) as a group, and, perhaps Japan. Canada can make an important contribution, but we cannot control either the agenda or the outcome. Even to influence the outcome requires adroit negotiators. The Community is reluctant to come to the table. The United States is eager, but as yet has no negotiating authority. The LDCs are willing, but insist on some problematic pre-conditions and do not agree on the agenda. Japan is willing, but largely because a new round would facilitate management of its trade relations with the United States and the European Community.

Canada's economic growth is critically dependent on secure access to foreign markets. Our most important market is the United States, which now takes up to three-quarters of our exports. More, better and more secure access to the U.S. market represents a basic requirement, while denial of that access is an ever-present threat. We are extremely vulnerable to any strengthening of U.S. protectionism. Early bilateral negotiations with the United States could provide opportunities for the two countries to negotiate reduction or elimination of tariff and other barriers to cross-border trade, at a pace and on a scale not likely to be achieved multilaterally in a further GATT round. Such negotiations could also be used to win agreement on rules designed to deal with special or unique problems affecting cross-border trade; they would provide a more secure shield against a U.S. policy of protection.

The pursuit of Canada-U.S. free trade is not at odds with efforts to strengthen and improve the existing multilateral framework. Rather, Commissioners see it as a complementary approach, involving concentration of our efforts and scarce resources on our most important market. We see multilateral negotiations proceeding in parallel. In our view, such a two-tiered approach is the best way to ensure that Canadian industry will win sufficient access to foreign markets to invest and grow with confidence. At the same time, it will allow us to open our market in an orderly fashion and thus ensure that trade policy dœs its part in encouraging the development of a more competitive and more productive economy.

Commissioners see negotiations with the United States as neither panacea nor disaster, but as a prudent course which will help to make us richer and, by making us richer, strengthen the fabric of our country and increase our self-confidence. While this course may initially make Canada more dependent on the U.S. market, it will offer our nation a more secure relationship and thus make us less vulnerable. Ultimately, it should strengthen and diversify our economy, achieving for us goals that we have long sought, but which have eluded us, largely because our domestic manufacturing sector has been too weak to attain them.

Negotiations leading to freer trade, whether pursued bilaterally or multilaterally, will be of little use if they are not supported by the right domestic policies. Our support for freer trade, therefore, depends in no small way on the recommendations Commissioners develop later in this Report. These recommendations should contribute to strengthening the competitiveness and productivity of Canada's domestic economy. Trade policy alone will not be enough.

Commissioners, like others who have enquired into Canada's relations with developing countries, see a need for Canada to take more positive action to help these countries through aid and trade measures. We have reached this conclusion, not only on humanitarian grounds, but also on the basis of our perception of Canada's own interest. Development of stronger links with these countries through aid and trade will pay dividends to future generations of Canadians, by contributing to a more stable world environment and by nurturing future trading partners.

We believe that the approaches we recommend below will help to strengthen our country. They will allow Canadians to pursue the gradual transition from a staple economy to a fully-industrialized modern economy, living in harmony with, but distinct from, our friends and allies.

Recommendations

■ Having carefully considered the analyses presented above, Commissioners make the following general recommendations:

- Canadians have benefited from and contributed to the multilateral system of trade and payments developed primarily in the last 40 years, and we should continue to support that system as the mainstay of our foreign economic policy. Canada is sufficiently strong and independent, however, to pursue bilateral intitiatives, including better economic relations with the United States, within the framework of multilateral relations.
- Canadian import policy in general should be based on a recognition of its costs to consumers and the costs of delaying adjustment. Canada should minimize any new protection, reduce protection gradually as part of bilateral or multilateral negotiations, and accelerate adjustment processes.
- Export promotion should be pursued aggressively and with greater reliance on private sector mechanisms, but the degree of subsidization this may involve should be within internationally accepted rules and practices.

International Trade

International trade is the life-blood of the Canadian economy. It is a major contributor to Canadian growth, jobs and real incomes. In view of the changing nature and patterns of international trade, Canadians are now confronted with several options in formulating trade policy. This Commission has identified three major approaches, each of which has several variations. Canada might:

- Maintain its present policy. It might keep to the level and type of protection currently in place, but make selective efforts both to improve access abroad and to protect Canadian industry on a limited case-by-case basis.
- Participate actively in a new round of multilateral trade negotiations under the auspices of the GATT, in order to improve and secure our country's access to foreign markets, to open up our own market, and to strengthen the legal framework for international trade.

- In addition to taking the initiative for the elimination of trade barriers at the multilateral level, open negotiations with the Government of the United States to reach an agreement on a substantial reduction of barriers, tariff and non-tariff, between Canada and the United States.

This Commission rejects any generalized move toward greater protection or toward import substitution as a general policy to insulate Canadian producers from the international economy. This approach, while perhaps the most comfortable in the short term, would lead, in the longer term, to major inefficiencies in the national economy, a loss of jobs and lower incomes, and would contribute to an erosion of the multilateral system. In our view, a policy of maintaining the *status quo* would carry the serious risk of taking Canada backwards to a more protectionist position.

■ Commissioners recommend that multilateral trade negotiations under the GATT remain a central theme of Canadian trade policy; thus Canada should move quickly to define its objectives for the forthcoming round. The GATT has served Canada well, and our nation's participation in further strengthening this international system of co-operation is a general insurance policy for the future. Broadly stated, Canada's objectives should include:

- A more ordered world trading environment: that is, sufficiently stable, predictable and transparent international trade relations to instil a degree of business confidence that will lead to job-creating investment
- More secure access to our major markets, particularly the U.S. market
- Improved opportunity for the further processing of our natural resources before export, by reducing foreign barriers to manufactured goods
- Improved access and trading conditions for agricultural and fishery products
- An improved framework of international rules which will encourage orderly adjustment in the Canadian economy.

■ Commissioners recommend that the Government of Canada, at the same time it undertakes an initiative at the multilateral level to eliminate trade barriers, open negotiations with the Government of the United States to reach agreement on a substantial reduction of barriers, tariff and non-tariff, between Canada and the United States. Such an agreement would have to stand within the terms of Article XXIV of the GATT, and it would provide for a reduction of barriers between the two countries, but would leave each country with freedom of action to maintain separate trading policies with other economic partners. We do not recommend a more intensive arrangement such as a common market or an economic union, where even closer integration would take place between these two economies.

- Commissioners recommend that Canada negotiate a legal arrangement with the United States which incorporates strong safeguards to limit spill-over from the arrangement and thus to protect substantive policies, such as those pertaining to culture and defence, which are functionally unrelated to trade in goods and services. Indeed, a policy that creates no linkage should be explicitly confirmed in order to avoid surprises if the Government of Canada, as we recommend, were to pursue a more aggressive policy of support for indigenous cultural expression as a concomitant of a bilateral trade initiative.
- Commissioners recommend that this legal arrangement attempt to regulate three general types of barriers that currently restrict trade between the two countries. We recommend that:
  - Tariffs be phased down to zero over a period of perhaps ten years. Effective rules of origin must be developed.
  - An approach should be developed to use measures of contingent protection as follows:
    - For measures governing "fair" trade (such as safeguard action) and "unfair" trading practices (such as anti-dumping and countervailing-duty proceedings), enforcement would be shifted from national administrative tribunals to a new Canada-U.S. intergovernmental body established under the arrangement; this body would be known as the "Canada-U.S. Trade Commission" (CUSTC).
  - Detailed codes of national conduct would be required to govern resort to other non-tariff measures such as discriminatory federal and state-government/procurement practices, product standards and federal customs, classification rules and administrative procedures. Again, these matters should be subject to review of the CUSTC.
- This Commission holds that a free-trade arrangement should incorporate explicit provisions which reflect the proportionately greater costs of adjustment that Canadians will face. The Canadian economy needs more time for adjustment than does the U.S. economy. We therefore recommend a two-track approach to phasing in the tariff cuts to allow U.S. rates of duty generally to be reduced either at a faster rate or earlier than Canadian tariffs. The Canadian government should quickly develop strategies for adjustment which are compatible with the framework of adjustment assistance proposed in Part V of this Report, that is, the new Transitional Adjustment Assistance Program. The emphasis of government programs should be on assisting workers to adjust to new employment opportunities. In addition, a reoriented industrial policy, as set out in Part III, will encourage the flexibility and growth orientation required by a freer-trade environment.
- This Commission recommends that the Government of Canada urge the Government of the United States to implement the

free-trade arrangement by amending U.S. federal and, if necessary, state legislation to conform to the arrangement, and that they do so under a "fast track" procedure which would require Congress to pass implementing legislation within 90 days of the President's formal declaration that he intends to sign an international agreement binding the United States. We also recommend, however, that a formal treaty eventually be struck once both governments have had sufficient experience with the arrangement.

- This Commission recommends that negotiations in Canada proceed on the basis of a broadly based, federal-provincial consensus, and that provinces be prepared to give legislative assent to the provisions of the arrangement, in keeping with the high degree of consultation that will be required to achieve federal-provincial consensus. We also recommend that in the longer term, Canadian governments establish a federal-provincial constitutional procedure: sections of the treaty that impose obligations on provinces would come into effect across Canada when two-thirds of provincial legislatures, representing at least half of Canada's population, passed resolutions in support of the treaty.
- This Commission recommends the formation of a three-tiered Canada-U.S. intergovernmental institution to provide basic executive and administrative decisions; technical staff services; adjudication of complaints and appeals under the agreement. We further recommend the following mechanisms:
  - A committee of national officials at the ministerial level to be responsible for the enforcement of the agreement's obligations
  - A supporting body of officials known as the "Canada-U.S. Trade Commission" (CUSTC) to manage non-tariff barriers, but subject to appellate review by the Ministerial Committee
  - A standing arbitral panel with binding powers as a board of last resort, to resolve disputes arising from conflicting interpretations of the agreement. Such a panel would consist of two Canadians, two Americans and one neutral member to be chosen by the members of the panel.
- International trade and industrial policy are inextricably linked. In Canada, there is the added dimension of cultural and social implications. To undertake successful negotiations on freer trade with the United States will require an extraordinary management effort by the Government of Canada. The Commissioners, while making no specific recommendation on how best to prepare the way for the negotiations, wish to express concern that the current federal departmental structure does not appear to provide the degree of integration required to carry out a major negotiation of this kind. It may be that an Office of the Special Trade Negotiator should be established, and that the incumbent should report directly to the Prime Minister.

Development Assistance

■ The motives of altruism and long-term national interest coincide in this Commission's recommendations for Canadian objectives pertaining to Canada's relations with developing countries. In pursuing these objectives, Canadians should be aware that the primary responsibility for development rests with the nations in question, and that although greater international efforts are required, difficult intranational, social and institutional issues are often the fundamental impediments to progress, just as they are in all nations. Commissioners recommend:

- An improvement in both the quantity and the quality of Canada's aid performance. Canada should advance to the Lima target of 0.7 per cent of GNP, not by 1995, but by 1990, and aim to achieve 1 per cent of GNP by the year 2000. The Canadian government should reduce the fraction of our aid which is tied, and to facilitate this reduction, we should rely more on multilateral than on bilateral aid.
- That Canada work within global institutions to improve the receptivity of these bodies to proposals helpful to developing countries. Canada should, for instance, systematically seek ways to involve developing countries more fully in a future round of GATT negotiations.
- That the Canadian government be ready to consider proposals for mitigating some of the more harmful effects of the international debt crisis on developing countries. Canadians should resist pressures for economic protection that would apply to exports from these countries. A more constructive and conciliatory approach to developing countries and their problems will not only help these countries, but also yield longer-term dividends for all countries. □

PART III

Growth and Employment

Conclusions and Recommendations

General

Canada's growth and employment prospects depend heavily on developments in trade and in the use of our human and natural resources. Regional development policy and the institutional framework of our federal form of government also affect our growth and employment prospects. Part III of this Report addresses other components that affect these prospects: the role of capital, technology and management; the choice of industrial policy; the demand management or setting of monetary and fiscal policies; and the flexibility of wages and prices in responding to the vagaries of the business cycle. While the following recommendations are addressed separately, their strength depends significantly on their integration with the recommendations in the rest of this Report.

Governments must be prepared to vary their role in the allocation of human, capital and natural resources in response to changes in external and domestic pressures. In general, however, governments should endeavour to facilitate the operation of the market mechanisms of our economy, rather than to seek occasions for further intervention.

> ■ **In the management of the economy, governments must acknowledge the considerable international and domestic constraints on policy. They cannot provide quick solutions to every economic difficulty. Rather, they should set the medium- and long-term framework within which solutions can be worked out.**
>
> **Although economic growth is a key means of increasing the welfare of all members of society, Commissioners do not advocate the pursuit of maximum growth at all costs. The claims of growth must be balanced against those of equitable income distribution, employment security and environmental quality.** □

Recent Performance and Prospects

Canada's post-Second World War performance was strong until 1973; after that date, inflation began to climb rapidly, and productivity growth declined. Since the 1981–82 recession, unemployment has been our most serious policy concern.

This Commission has examined four independent projections of Canada's likely economic performance in the absence of major policy changes. These forecasts suggest that Canada's growth rate in real gross national product over the next two decades will closely parallel the U.S. rate. Annual real growth in Canada should average 3 per cent during the late 1980s, and decline to about 2.5 per cent during the 1990s, in keeping with a decline in the rate of labour-force growth. The growth prospects for natural resource-based production seem weak, especially in mining and forestry.

> ■ Most analysts predict that unemployment will remain at relatively high levels in Canada throughout the 1980s. Current high rates of unemployment are associated with insufficient total real demand relative to total supply. In addition to this critical problem, there are major structural problems which, unless addressed, will not allow unemployment to drop below 6.5 to 8 per cent over the long term. This level is unacceptable by this Commission's standards, and the problem of reducing the structural unemployment rate must be addressed. □

Employment growth and productivity growth are essentially independent. Growth in the labour force is the principal cause of employment growth. Productivity growth increases both the supply of output and real demand to roughly equivalent degrees. Thus, growth and employment goals are not in substantial conflict over the longer run. We can improve productivity without harming long-run employment growth; more generally, technological unemployment is unlikely to become a major problem. Rather, increased productivity and technological change are the key to longer-term growth in real income and economic welfare.

Some fields have experienced an increase in the rate of technological innovation over the past two decades, but the overall rate is difficult to estimate. The decline in productivity growth since 1973 might suggest a decline in the pace of technological innovation. However, the recent increase in the share of gross national expenditure spent on research and development (R&D) in the United States and Canada will raise the pace of technical change and contribute to a recovery in productivity growth.

Industrial Policy

Canada's industrial policy has shifted since 1945, emphasizing, in turn, nationalistic goals or trade liberalization, development of the manufacturing sector or development based on natural-resource wealth.

Industrial policy in Canada incorporates a wide range of policy instruments, some of which have purposes related to trade or to general economic policy. Neither the federal government nor the provinces have blueprints for industrial policy. T[illegible] omission reflects a fundamental reliance on market forces and private-sector enterprise as the engine of growth.

Commissioners' review of foreign industrial policy indicates that policies that work in some countries may not work in others. Despite Japan's low expenditure on R&D, that country has been successful in the knowledge-intensive industries. France and Germany have very different industrial policies, despite being members of the European Community. France has a highly targeted interventionist approach, while Germany's approach is more market oriented. There would seem to be no particular mix of industrial policy instruments that ensures success.

Canadians differ on the proper role of government in promoting economic growth and employment. The polar extremes of a strictly hands-off approach and a highly interventionist, targeted, industrial policy appear to overlook the complexities of policy formation and practice.

■ Relative to current practice, Commissioners favour a more market-oriented industrial policy. More particularly, we favour letting the market work and placing less emphasis on government intervention to protect declining industries. We have reviewed the possibility of a more specifically targeted approach – the strategy of "picking winners" – but we believe it unlikely that such a highly interventionist approach would meet with greater success overall than would a more neutral policy.

For several reasons, some modes of intervention make sense; hence Commissioners do not favour a strictly hands-off approach. Furthermore, while there is little evidence in Canada or abroad that a targeted industrial policy is more effective than a market-oriented approach, other countries will continue to experiment. Canada should monitor these experiments carefully and consider strategic ways of strengthening its areas of comparative advantage. In our judgement, however, Canada has relied on intervention too often, too extensively and in too *ad hoc* a fashion.

Canada's industrial policy should emphasize broad-based support programs that work in tandem with basic market forces. To the extent that government involvement is required as, for example, in R&D support, benefit/cost criteria should guide it.

This Commission dœs not propose a blueprint for industrial development; indeed, to attempt a detailed formulation would be counter-productive. We believe, however, that consistent with our emphasis on market mechanisms, there should be a clearly stated framework for industrial policy. Such a framework would facilitate both private-sector decision making in Canada and the co-ordination of government policies and programs. This stated framework should express the strategic objective for industrial policy. Commissioners believe that the productivity of Canadian industry should predominate over other concerns, and that we should concentrate on improving our competitive position.

Commissioners believe that industrial policy should fortify incentives for excellence, for the efficient allocation of resources, and for adjustment to new economic realities. Such a policy would produce increases in real income, fuller employment and the means to address income distribution.

To improve the productivity of Canada's human, capital, and natural resources, and the competitive position of Canadian industry, industrial policy should include the following elements:

- A supportive macro-economic framework that while controlling inflation, promotes growth of output and employment at a reasonably even pace, in accordance with the economy's capacity
- A commitment to freer trade and the freer flow of investment. We favour both multilateral freer trade and bilateral free-trade negotiations with the United States.
- A commitment to strengthening Canada's labour, capital, technology and management resources.

Capital, Technology and Management

Recommendations respecting education and training are addressed in Part V of this Report.

■ With respect to capital, technology and management, this Commission makes the following recommendations.

Capital Formation

- International comparisons suggest that Canada has not suffered from any serious lack of investment over the last two decades. However, some recent economic analyses indicate that the tax treatment of savings and investment may result in a capital stock (that is, national wealth) that is too small.
- While this Commission has not reviewed the tax system in detail, it does appear to us that government should examine the effect of this system on savings and capital formation. This examination should consider the adequacy of the current allowances for inflation in the tax treatment of savings and investment. It should also consider the desirability of altering the current personal tax system by substituting an expenditure base for the income base.

Domestic R&D

The effectiveness of R&D expenditure is more important than setting a target level in relation to GNP.

- To increase the effectiveness of domestic R&D, governments should consider the following measures:
  - Ensure the availability of existing incentives to all business through some type of refundability of tax losses.
  - Broaden the definition of R&D while lowering the rate of tax subsidy, even though we recognize that such a broadening could give rise to administrative problems.
  - Ensure that adequate resources are devoted to obtaining information about foreign technological developments and to disseminating information on technological developments to domestic industry.
  - Encourage excellence by concentrating Canadian effort on projects, research and development of world-scale value through "networking" between experts within Canada, as well as internationally.
  - Reduce protection of domestic industry and encourage it to be more competitive internationally.

Technological Acquisition

New technologies are increasingly shared on a global basis, and the originating country has little lead time over others to exploit its advantage. Canada draws extensively from the world pool of new technologies, in part through investment in Canada by multi-nationals. New manufacturing technologies spread more slowly in Canada than they do in other countries.

- A potential solution is to liberalize trade and to reduce the existing barriers to the flow of equity capital.
- Public policy in education and the gathering and dissemination of information could improve technological adaptation in Canada. Post-secondary institutes should place more emphasis on science, engineering and business courses. Universities should be more active in the commercialization of inventions. The National Research Council's initiatives on information gathering and dissemination could be a model for other agencies. Technology brokers, contract-research organizations and think-tanks have assisted technology acquisition in other countries. Both the private and public sectors in Canada should consider more activity of this nature.

Management and Entrepreneurship

- Increased international competition demands that Canada draw on world-class management. We should have greater exposure to competition, a reorientation of small-business/assistance programs, and strengthened business schools. Closer bonds between business and the arts community would improve product design.

- Entrepreneurship is another key component of national economic development. While small business is a vital source of entrepreneurship, other sources also require encouragement. Governments should consider changing regulations to stimulate equity investment by financial intermediaries in small and medium-sized firms, and change the tax system to make equity ownership more attractive.

Framework Policies

Another element that is needed to improve Canada's economic position is a commitment to framework policies that encourage the private sector to adapt to change and the efficient allocation of Canada's human, capital and natural resources. Framework policies include tax policy, competition policy, general regulatory policy, foreign investment and adjustment policy.

■ Our recommendations in each of these areas are as follows.

Tax Policy

- While Commissioners have not undertaken a comprehensive review of tax policy, they have investigated the issue in general terms and looked at some specific problems. Tax policy has a fundamental influence on economic and social choices.
- We recommend a thorough review of the influence of the tax system on decisions that distinguish work and leisure, and consumption, savings and investment. Policy makers must become more aware of the efficiency costs of the tax system. In addition, Canadian tax policy must recognize the fluidity of capital flows.
- There appears to be merit to building on recent changes that moved personal income tax in the direction of a personal consumption tax.
- Governments should review non-neutralities in the corporate tax structure and consider indexing of capital assets for inflation. Alternative accounting methods of defining the corporate tax base, such as the cash-flow approach and the refundability of negative taxes, are also worthy of review. Such provisions could replace fast write-offs of exploration and development expenses in the resource sectors, and accelerated capital-cost allowances in the manufacturing sector.

Competition Policy

Canadian industry appears to have become more concentrated at the producer level over the past decade. However, trade liberalization and deregulation have reduced concentration at the seller level. Mergers and conglomerates can result in undue concentrations of economic power; they can also improve efficiency and competiveness internationally.

- Canada's competition policy should better reflect both of these realities. Commissioners recommend that Parliament empower the Director of Investigation of the Combines Investigation Act to report on all developments that impede competition in Canada, including trade protection and regulatory provisions. We recommend further that governments exercise greater discretion respecting mergers and conglomerates, directing restraining provisions to those cases where a clear threat to competitive practices is evident. With increased trade liberalization, the primary area of concern could be the non-internationally trading sectors of the economy. Canadian firms should retain the right to co-operate with one another in export markets, provided that they do not reduce domestic competition, and clarification should be offered through advance rulings. All large corporations, public and private, Canadian owned and foreign owned, should be required to file annual reports with the government.

The Regulatory Framework

Commissioners do not accept the simplistic notion that regulation should always be kept to a minimum. Some current problems, such as those associated with the environment, can probably be addressed only through an increase in regulatory activity. In many other areas, however, a reduction in regulation, and a concomitant increase in competition, would substantially increase economic efficiency. Even where regulation is necessary, it could in many cases be made simpler and more responsive to changing conditions.

- We recommend that government undertake to review and reform the regulatory framework as a whole. Regulatory agencies should be subject to closer Parliamentary scrutiny than they are at present, and their mandates should be more clearly and closely defined. Whenever possible, regulatory activity should be subject to a "sunset clause": that is, it should be limited in advance to a specific term.

Crown Corporations and Privatization

- The sale of some Crown corporations to the private sector would be a logical adjunct of deregulation, since it would enhance competition. By the same token, the federal government and the provinces should arrest the tendency toward nationalization or mixed enterprises, particularly insofar as this tendency is associated with industry bail-outs. Both levels of government should reassess the functions of these Crown corporations and mixed enterprises. If the functions or objectives of a given Crown corporation could be met more effectively by other means, the enterprise in question should be either phased out or sold to the private sector. If a Crown corporation is to be privatized, foreign buyers should not normally be excluded from bidding for the assets. Exceptions to this rule include cases where purchase by a foreign buyer would result in barriers to entry by other competitors, or where the industry in question should be reserved for Canadians.

Foreign Investment

Over the past 15 years or so, Canadian ownership of our industries has increased substantially. It is now appropriate to re-examine mechanisms for monitoring foreign investment in Canada. Bill C-15 provides some useful guidelines, but further innovations are required to balance the need for international equity funds and the need to foster good corporate citizenship.

- The review of foreign investment proposals should be conducted by a quasi-judicial tribunal to ensure full public disclosure and political accountability. Fast-track procedures and practices for the handling of commercial confidences would need to be developed. Commissioners believe that new foreign investments need no longer be reviewed; the tribunal should review acquisitions only. The threshold for review should be raised from $5 million in gross assets to at least $50 million in order to focus resources on the larger and more critical take-overs. The review process should emphasize the competitive and technological conditions surrounding the proposed foreign take-over. The government should clarify the standards governing the post-entry behaviour of foreign investors by promulgating a general code of conduct applicable to all major firms, domestic and foreign, operating in Canada. To promote compliance with the code of conduct and to improve our understanding of the consequences of foreign control, the government should legislate an annual reporting requirement for all major firms or for corporate groups operating in Canada with assets in excess of $50 million. Firms should be required to disclose specified types of information relevant to their observance of these guidelines. Canadian directors should be required to file an annual statement detailing their firm's efforts to achieve the objectives of enterprise performance set out in the proposed code of conduct.

Adjustment Policy

- Whenever possible, adjustment assistance should be provided to workers rather than to firms. Commissioners recommend the institution both of tougher international agreements and of mandatory reference to a neutral agency, such as the Tariff Board, in order to make it more difficult for governments to resort to protection of declining industries. By the same token, we also recommend that it be made more difficult for governments to resort to the use of firm-specific subsidies; this could be done by attaching conditions to the recipients, and by requiring the costing of off-budget subsidies. If firm-specific subsidies are given in declining sectors, the assistance should go to the most viable, and not the weakest, firms. Part V deals at length with our recommendations regarding labour adjustment policies. Declining single-industry communities require special labour-adjustment assistance.

If the economy is flexible and adaptable, adjustment will probably be much easier, and involve less unemployment. In addition, real income levels will be improved. Flexibility in prices and wages – or, more generally, the development of successful incentives – is the key to achieving a flexible and adaptable economic structure.

Infrastructure Support Services

This Commission views policies regarding transportation, communications and infrastructure generally as vital components of an industrial policy designed to enhance Canada's productivity growth and overall competitiveness. Commissioners note with concern the shrinking share of government expenditure devoted to such infrastructure.

■ We urge both the public and the private sector to view investment in the transportation and communications field as a priority. While Commissioners recognize that a strong public role in this field is both inevitable and desirable, we conclude that deregulation and a more market-oriented approach is desirable.

The private sector should be encouraged, through the tax system and government programs, to adopt the technological and other measures necessary to establish a first-rate transportation and communications network across the country. Canada needs better mechanisms for accommodating divergent regional-investment policies and regulatory policies that have national implications.

Government Intervention

■ Government should provide itself with a clear set of guidelines to determine the nature of its intervention at the sectoral or firm level. Given the difficulty of measuring the costs and benefits of intervention, Commissioners recommend that selective intervention be used sparingly. Few cases warrant special attention, and the burden of proof should be on those that propose intervention at the sectoral or firm level. A strict limit on the funds budgeted for intervention is essential. Intervention should be undertaken only where there is clear evidence of market failure, or in industries that exhibit substantial economies of scale, or where high risk and large size make it difficult for market forces to operate adequately. Where these considerations prevail, the following guides should apply:

- The benefits of intervention must demonstrably exceed its costs.
- If efficiency is not the overriding objective, the objective should be achieved at the least cost.
- There must be sufficient consultation with business and labour to ensure that the chosen means of intervention are appropriate.
- International obligations must not be jeopardized.

The Economic Union

■ A commitment to a strengthened economic union is a vital element of a healthy Canadian economy. Barriers to the free flow of labour, capital goods and services should be minimized, and integration of policies should be harmonized. □

Stabilization and High Employment

For structural and institutional reasons, the rate of unemployment consistent with stable inflation in Canada is in the range of 6.5 to 8 per cent. Expansionary monetary and fiscal policies cannot sustain levels of unemployment below this range over the longer term. A permanent reduction in such "structural" unemployment would require structural changes, by which we mean such policies as freer trade, labour-market adjustments, and new mechanisms for labour-management relations.

The current rate of unemployment (about 11 per cent) is well above the rate consistent with stable inflation. This unacceptably high rate is the result of an insufficiency of total demand relative to total supply. Impediments to reducing unemployment by even 3 to 4.5 percentage points are the large federal government deficit, the high real current rates of interest and the extraordinarily complex role played by expectations.

Limitations in forecasting and lags in the effect of policy action argue against moderating short-run fluctuations in economic activity through discretionary action. The federal government should use stabilization policy to achieve non-inflationary growth in demand in the medium term, while preserving automatic fiscal stabilizers. However, economists disagree about the strength of the self-righting forces in the economy, that is, the forces that will drive unemployment toward its "natural" or full-employment level. Commissioners believe that discretionary stimulus or restraint can help in periods of major extended divergence in demand from a non-inflationary growth path.

Global interdependence, especially in capital markets, limits the degree to which policy can insulate an open economy such as Canada's from foreign developments. Given our flexible exchange rate, we can choose our inflation rate in the long run, and to that extent, we can have a made-in-Canada macro-economic policy. But the influence that we can hope to have on real demand in our own economy is likely to be short term in nature and rather limited in scope.

- To preserve independence in domestic policy for Canadian authorities, this Commission recommends a flexible exchange rate. We do not recommend exchange controls or an interest equalization tax to control capital outflows.

Commissioners share the widespread concern about the size of the federal government's deficit. We recognize that if the government does not reduce the current structural deficit, it will have to increase taxes just to pay interest costs and will find its flexibility seriously constrained.

- Commissioners recommend a strategy of gradual deficit reduction, given the current outlook of slow recovery. To stabilize or decrease the debt/GNP ratio, the government will need to reduce the deficit by about 1.5 per cent of GNP, which would be equivalent to $10 billion by 1990–91. The practice of laying out an explicit medium-term fiscal plan, introduced in the December 1979 budget and continued since, is useful. We favour using a combination of tax increases and rather broad expenditure reductions to reduce the deficit. The precise means of achieving this reduction are a matter for shorter-term government policy, but Commissioners offer one possible means for consideration. This would be to set the indexing factor for the personal income tax and for some transfer-payment programs at *x* percentage points below the rate of inflation and to hold the price factor for all other expenditure programs – except foreign aid and national defence – at *x* percentage points below the rate of inflation. Setting these annual indexing factors three percentage points below inflation for a period of three years would generate a reduction in the deficit of about 1.5 per cent of GNP, thereby reducing the deficit and by that amount the deficit/GNP ratio from the 6 to 7 per cent range projected for the late 1980s.

- Under present circumstances of high unemployment, a shift to a less expansionary fiscal stance, so as to reduce the deficit, should be more than matched by a temporary shift to a less restrictive monetary stance. A moderate increase in the projected growth of demand, which might significantly reduce unemployment and strengthen investment, should still be consistent with a further reduction in inflation.

While Commissioners recognize that adherence to a steady monetary-growth guideline can help to ensure that a stable, non-inflationary environment will be maintained, shifts in the demand for money during the past few years have made this approach difficult to apply. Furthermore, such an approach might lessen governments' ability to adjust the mix of monetary and fiscal policy in order to balance consumption and investment, and to balance the sectors of the economy that are strongly influenced by the exchange rate and the sectors that are not.

■ As a compromise solution, the government could relate demand-management/policy targets to the growth of nominal GNP. This policy would require a willingness to adjust both monetary-growth targets to nominal GNP, in the event of significant shifts in relation of the money supply, and monetary and/or fiscal policy in the event of severe prolonged departures of nominal GNP from a steady growth path. Commissioners recommend that the joint setting of monetary and fiscal policy be consistent with non-inflationary growth of nominal demand.

Commissioners have also considered potential adjustments to lessen the distortions and damage that any continuing inflation imposes. We share what seems to be a general preference that has emerged over the last few years, to emphasize low and stable inflation rather than structural adjustments that would make it easier to live with inflation.

■ Despite the preceding conclusion, Commissioners believe that serious consideration should be given to indexation of financial assets, accounting systems and tax systems. To adjust the tax system to take inflation into account would improve its neutrality in general and lessen the incentive to rely on debt financing in particular.

In Commissioners' judgement, permanent wage and price controls or even a permanent tax-based incomes policy would probably not prove acceptable to Canadians and would not be consistent with our general approach of promoting a flexible, adaptable and growth-oriented economy.

■ We do, however, recommend the temporary use of controls or incentive-based incomes policies if the country needs to reduce inflation again. Furthermore, the use of temporary controls could bring about a more rapid reduction of unemployment than presently seems to be in prospect. Such temporary controls should be the subject of negotiation with business and labour groups.

Commissioners believe that a formal voluntary incomes policy, which would involve commitments to respect common guidelines for wage increases and for price or profit patterns, will be difficult to achieve, given the structure of labour and product markets in Canada.

■ We recommend, however, continued informal and formal consultation on a broad range of economic issues, and increased openness about the bases of economic policy formation. Such an approach might assist public understanding and encourage realistic attitudes about wages and prices. It might also contribute to lower unemployment.

■ Commissioners believe that gain sharing – that is, making compensation more dependent on the current performance of the firm or industry – offers the most promising approach to achieving greater cyclical stability in employment and productivity growth.

Gain-sharing would be viable only in an environment of greater trust and openness, and thus we tie our recommendation for its use to our position on consultation noted above.

Commissioners recommend to labour, business and governments that they consider some form of incomes policy, coupled with supportive monetary and fiscal action, to increase employment. Without such a comprehensive approach, reduction of unemployment to the level of 6.5 to 8 per cent may be a lengthy and difficult process. Furthermore, without such a demonstration of political will by all major groups in society, and by individuals as well, the prospects for undertaking major structural changes to reduce unemployment below 5 per cent would appear to be less bright. This basic challenge of political will is the central determinant of improved economic performance. □

PART IV

Natural Resources and Environment

Conclusions and Recommendations

The natural resource sector's contribution to Canada's economic well-being, cultural life, and political traditions and institutions has been immense. Because natural resources have been so important to Canada's past, however, we tend to exaggerate their importance to our future. In fact, the resource sector has not grown at a rate commensurate with the economic expectations we have developed in the years since the Second World War; nor does its projected growth match our hopes for the decades to come.

It has become clear in recent years – if it was not clear before – that Canada's natural resource endowment is not unlimited. We are losing our agricultural land to suburbs and shopping centres. Our stands of readily accessible, high-quality timber are largely gone, and our richest and most accessible deposits of ore and fossil fuels are already in production. Our mismanagement of the fishery has meant that we have not been able to reap the potential benefits of the designation of the 200-mile offshore zone in 1977. These problems of supply are compounded by prospects of lower demand in world markets for forest products and most non-fuel minerals. Moreover, our forestry and minerals industries can expect increasingly stiff competition from countries with lower production costs, and this competition will be made all the more difficult by the rapid advances in products and process technology.

These problems do not mean that our basic resource industries will disappear. Relative to other nations, Canada remains well endowed with natural resources. The outlook for oil and gas, a few minerals, hydroelectricity, and Western grains is favourable. The dollar value of production in the resource sector will continue to grow. Nevertheless, the share of output in this sector will decline, relative to the share of output in other sectors of our economy, although the decline will not be as rapid as it was in the first two post-war decades. Total exports of resource products will continue to expand, and the terms of trade are unlikely to turn against us in any dramatic fashion. Increasingly, however, we shall have to supplement resource exports with exports of more highly processed products if we are to maintain our capacity to buy the goods and services of other nations. The pattern of relative decline will mean that we can generally expect no net gain in resource-sector employment in the future: a growing proportion of Canadians will find their jobs in factories or offices. Indeed, the decline in the resource sector's share of total employment is the clearest indication that the sector will not be the engine of economic growth that it was in the past.

The prospect of a decline in the relative importance of the resource sector in relation to our national economy is no reason to neglect that sector's problems or its claims. Resource industries are still essential to the economic life of many regions of Canada. Moreover, we have an obligation to pass on to future generations a variety of viable resource industries founded on a natural endowment that is as secure and as healthy as we can make it. Canada's success in resource production owes as much to human ingenuity as it does to the resource endowment itself, and many of the problems of the sector can be overcome, or at least diminished, by appropriate applications of that ingenuity. We must apply new methods, new processes, new public policies, and new thinking to the problems of maintaining both the competitiveness of the resource industries and the integrity of the natural environment that is their base.

■ Chapter 12 set out this Commission's detailed recommendations for the individual resource sectors. The thrust of our recommendations for dealing with the challenges ahead in each resource sector is as follows:

- For agriculture, we recommend a range of measures, from expansion of foreign markets, to increased R&D, to reform of national supply-management marketing boards, planned to enhance the efficiency of a sector which has great potential over the long term.
- For forestry, we recognize a legacy of mismanagement and recommend significant changes in the way the forest sector operates, as well as a major infusion of public and private investment.
- For the fishery, what has been lacking is political will, and we recommend measures to build on the fundamental reforms of the Kirby and Pearse Reports to shift the balance in public policy toward building a viable economic base in Canada's coastal regions.
- For minerals, we recognize generally the more limited possibilities. We recommend a more realistic approach to adjustment and a movement towards a profit-based tax system.
- For energy, we recommend a new framework based on the principles of efficiency, fairness and predictability, and a complete overhaul of the fiscal regime for oil and gas.

- For the environment, we recognize the growing challenge and the need to integrate decisions related to environment and economic development. We recommend a series of measures to correct the incentives which are aimed at protecting the environment; and, in general, we propose strengthening the regulatory framework.

Commissioners believe that it is important, however difficult, to assess the problems and opportunities of the resource sector in a more comprehensive way, just as, for example, governments focus from time to time on the general issues of the manufacturing sector.

■ The following general principles briefly relate Commissioners' detailed recommendations to the management of the resource sector as a whole:

- We conclude that in Canada, with all its rich resource heritage, there is no conflict, in the long term, between the stewardship, preservation and enhancement of the natural resource base and growth prospects for the traditional resource industries. Consequently, we perceive a vital need to integrate environmental decisions and decisions related to economic development, and our proposals for action in each of the particular resource sectors reflect this perception. Thus we recommend a study of the loss of prime farm land to non-agricultural uses and emphasize our concern about the problem of soil deterioration and soil salinity. We support the infusion of large sums of both public and private monies into reforestation and silviculture, and we recommend that the duration of leasing agreements between governments and forest companies be increased in order to provide an incentive for long-term management of forest tracts. Finally, in recognition of the fact that natural resources belong to the Canadian people and must be passed on to future generations, we believe that private developers should continue to pay governments a royalty based on production for oil and gas and minerals.
- In many other places in this Report, we call for less government intervention; in the area of environmental regulation, however, we are obliged to call for more. Over the long term, the task of environmental regulation promises to be immense. We shall have to deal with growth in the number and size of projects that may adversely affect the environment, with an increasing number of pollutants and hazards, with the irreversible, and sometimes unquantifiable, effects of a growing range of industrial substances and processes, and with the emerging international aspects of our environmental responsibility. Consequently, we recommend that governments increase their spending to provide the analytical resources needed to support

the long-term regulatory task. We further recommend that federal environmental processes be put on a statutory basis, and that federal and provincial review processes be brought into greater harmony.

- Changes in the pattern of world trade have offered new opportunities and new challenges to the Canadian resource sector. Our ability to realize the opportunities – and to survive the challenges – will depend on our ability to design resource strategies suited to a global context. This consideration has led us to recommend that the grains sector and the fishery sector pursue marketing and production strategies that will give them access to the new and rapidly growing markets in the developing countries. Whether it is a question of expanding our markets or of beating the competition, we believe that it is within Canada's interest to work for free trade, both at the multilateral level and at the bilateral level, with the largest purchaser of Canadian resource products, the United States. The adjustment problems that would derive from freer trade and the bargaining tactics that would be necessary to bring it about would vary with each resource.
- We believe that in many instances a stricter adherence to market principles and an increase in the incentives to the private sector would brighten the prospects of Canada's resource industries. Thus we consider that a commitment to market pricing for both oil and gas would provide the incentive essential to increased exploration and development. For oil and gas and minerals, we believe that the establishment of a taxation scheme based largely on profits rather than on output volumes would both promote the development of marginal supplies and allow the industry to make more rational resource-allocation decisions. Although we do not advocate transferring ownership of forest tracts to private industry, we do suggest that such modifications to the land-tenure system as increasing the duration of leasing agreements would promote more responsible forest management. Finally, we recommend a phasing-out of national agricultural-supply/management marketing boards and their replacement by an income-stabilization scheme designed to moderate large fluctuations in farmers' incomes.
- We believe that there is room for significant improvement in the efficiency of both the regulatory framework and the handling, licensing and transportation infrastructure that supports the resource sector. We underline the important effect of the Crow Rate on the transportation of all bulk commodities, especially Western grains. We support further movement in the direction of market-rate principles when the Western Grains Transportation Act comes up for review, but we leave it to the Committee of Inquiry on Crow Benefit Payment (Hall Committee) to advise on specific adjustments to the payment of the Crow

Benefit. In the minerals area, we recognize that the regulatory structure is cumbersome and slow, and we recommend that governments undertake a systematic review of their regulatory processes with a view to streamlining them. We would also draw attention to the fact that fisheries management has all too often led to overcapacity, unnecessary tensions, uneven product quality and, thus, lost opportunity. For oil and gas, we recommend a simpler taxation regime and a simpler pricing formula, both of which would decrease medium- and long-term uncertainty.

- The resource sector has undergone far-reaching adjustments since the Second World War. Further adjustment will be both essential and unavoidable, although perhaps less dramatic than it has been in the past. We believe that if a given operation has failed to realize a profit over a sustained period, adjustment is inevitable and should be allowed to take its course; governments should not intervene to support uneconomic activity. Mines that can no longer produce an ore competitively should be phased out, and we believe that in general, the same principle holds for the fishery. As we pointed out above, however, government action is necessary in some areas to guard against deterioration in the quality of our renewable resource base. In particular, we recommend a substantial increase in both public and private expenditures for the renewal of the Canadian forest.

  There must be and can be a balance in the adjustment process between efficiency and fairness to people whose livelihoods or communities have long depended on traditional resource industries. In the case of the family farm, we recognize the special problems created by farmers' limited access to equity capital, by the volatility of farm prices, and by the principle that the land is to be passed to future generations. We therefore support the retention of special credit schemes for agriculture and, as mentioned above, we urge consideration of an income-stabilization scheme to replace national supply-management boards. By the same token, we support replacement of Unemployment Insurance for fishermen by a new production-bonus and income-stabilization program, a scheme that would promote more efficient behaviour without reducing total benefits. Fishermen would also be eligible for income supplementation under the Universal Income Security Program (UISP) proposed in our recommendations on social security. In the minerals sector, we recommend the provision of adjustment assistance for communities and individuals affected by mine closures.

- Research has a large pay-off, but often the benefits seem too distant to the producer of the resource to justify the expenditure. We recognize that there must be renewed Canadian effort in fundamental research, especially in the traditional resource industries, if Canada is to match progress in competitor countries. Research into soil deterioration and new crop varieties warrants long-term funding by government. So does research related to aquaculture and to maintenance and improvement of the forest base. We have also called for an increase in expenditure on training in forestry. Finally, we support a stepped-up research effort in the field of environmental management, where we believe that the institutional capacity to provide scientific advice on a systematic basis is essential.

- In view of the importance of resources to Canada's future economic prospects and of the need to take a more integrated view of the problems and opportunities in the resource area as a whole, we recommend the establishment of a Council of Resources Ministers to provide leadership for increased federal-provincial co-operation. We recognize that various ministerial groups (for example, on agriculture and mines) now exist, but we believe that it is important for a co-ordinated strategy across the range of resources to be developed, based on the principles we have outlined above. We also recommend the development within the federal government of a greater capacity to analyse the contributions and problems of the resource sector as a whole. □

PART V

Human Resources and Social Support

Conclusions and Recommendations

This Commission wishes to make a number of general observations concerning some of the issues we have reviewed in this part of our Report. Several of the major recommendations proferred in this section are best considered as a package. Thus the reforms Commissioners propose for Unemployment Insurance (UI), the new Universal Income Security Program (UISP) and the new Transitional Adjustment Assistance Program (TAAP) would have maximum efficacy if they were implemented together. The savings generated by the UI changes would finance the TAAP, and the UISP would provide financial assistance if some incomes were lowered by the adjustments. The TAAP would support the effect of changes in the UI system that would promote economic adjustment, while the UISP and some elements of TAAP would cushion any resulting difficulties experienced by individual Canadians.

Since the overall level of social policy expenditures in Canada is low by OECD standards, there is no strong general case for attacking the deficit by reducing social expenditures. However, reallocation and restructuring could greatly improve the system and would be valuable in providing help to those who most need it, while containing overall costs.

Looking forward, Commissioners can see no trends that will inevitably undermine the fundamental viability of social programs. Such factors as the aging of the Canadian population or the demands imposed by technological and economic change require careful planning, but none is likely to prove so large as to make our programs unsustainable, particularly if the reforms suggested in this part of our report are carried out.

We Commissioners are of the opinion that tax and transfer systems cannot be given valid consideration in isolation from each other. Thus, major reform of our income-security programs also requires reform of some aspects of personal taxation.

Labour Markets and Unemployment Insurance

After considering Canadian labour markets, Commissioners are of the view that Canada's most important goals are to create more jobs and to improve the situation of individual Canadians by eliminating any inappropriate incentives in current programs. We undertook our analysis on the assumption that current trends in participation rates will continue, bringing a steadily increasing proportion of women into the labour force. While these trends are basically manageable, particularly given our assumption, detailed in Part III, that labour supply itself creates demand for labour, they do portend continuing high levels of unemployment – and continuing preoccupation of policy makers with that problem – for the next five to eight years, and they do add significantly to the training requirements Canadians must face.

We note in our analysis of labour markets that the highest proportion of current unemployment is either created by deficiency of aggregate demand or by structural factors such as mismatches between available job requirements and skills. A significant amount of unemployment is also created by "frictional" effects, that is the inevitable lags and delays as workers move from one job to another. We have dealt in Part III with aggregate demand deficiency. Here we recommend several measures to facilitate adjustment and training, thus reducing structural unemployment. We also recommend changes in unemployment-insurance and income-security programs which will lower frictional unemployment. Without undertaking changes such as those we are recommending, it will be almost impossible, even in the long run, to reduce unemployment below 6.5 to 8 per cent of the work-force, the current non-accelerating inflation rate of unemployment (NAIRU). Since we consider even those levels to be unacceptably high, we lay great emphasis on these types of reform.

Some increase in unemployment is also engendered by our existing UI programs. First, by making unemployment relatively "cheaper" for individuals, it has, in some cases, a negative effect on job search. Secondly, by providing, through its benefit structure, that individuals in some areas may qualify for 40 weeks of benefits by 12 weeks of work, it encourages regular cyclical unemployment; a feature taken advantage of by both employers and employees. Again, by providing extended benefits in some areas but not others, it discourages labour-force adjustment, while providing no extended benefits to large numbers of unemployed Canadians. Moreover, because its premium structure is unrelated to the risk of unemployment, it penalizes steady employers and employees and shifts benefits towards firms and employees with unstable employment patterns.

■ With respect to Unemployment Insurance, Commissioners recommend that the federal government consider a package of changes such as the following:

- Experience rating which establishes premium rates that are proportional to the risk of unemployment. These rates should generally be calculated on a firm-by-firm basis.
- A reduction of the benefit rate to 50 per cent of insurable earnings

- An increase of the entrance requirement to 15-20 weeks of insured work over the preceding year
- Tightening of the link between the maximum benefit period and the minimum employment period; for example, establishing a ratio of two or three weeks of work as qualification for one week of benefits
- Elimination of the extended benefit period based on regional unemployment rates.

These changes would reduce UI benefit costs by at least one-sixth in respect of the reduction in benefit rates and approximately one-sixth in respect of the elimination of regional extended benefits. The cost reductions that could be achieved by the other changes are too sensitive to behavioural change even to be estimated by methods available to this Commission. However, total savings of at least $4 billion at April 1985 rates of unemployment are probable.

- Commissioners therefore recommend that:
  - The savings in respect of the first three UI reforms be passed along as reductions in overall premium levels. (The regional extended benefits are financed from consolidated revenues.)
  - Personal and corporate taxes be raised by an amount equivalent to premium reductions to create a Transitional Adjustment Assistance Fund. The government savings from termination of extended benefits should be added to the fund.

■ This Commission recommends that the Transitional Adjustment Assistance Fund be used to finance a Transitional Adjustment Assistance Program. This program would provide adjustment assistance for Canadians who have exhausted their UI benefits, or whose lay-offs appear permanent, provided that they were willing to move or to undertake retraining to improve their employment prospects. The program would provide greatly expanded support for:
- Portable wage-subsidy programs
- Mobility grants
- Training programs
- Early retirement.

In addition, the TAAP could be used to provide compensation for losses in assets, such as housing, which occur as a result of the decline of communities. It should also be possible for TAAP funds to be used on a pooled basis to assist workers to purchase equity in plants which would otherwise shut down or in other forms of local economic development projects. In general, the extent of entitlement of workers to TAAP funds should be proportional to their length of attachment to the labour force, since older workers will typically experience greater transitional difficulties than younger workers.

■ Commissioners recommend that existing policies promoting equal pay for work of equal value should be maintained. However, these may involve some negative consequences. If they are used apart from affirmative action programs, for instance, they may actually result in reductions of employment opportunities for disadvantaged groups. Moreover, they can serve to move Canadians too far away from a market-determined to an administered wage system. Commissioners therefore recommend that legislation emphasize creation of equal employment opportunities through affirmative action, rather than the principle of equal value. Commissioners generally approve the approach put forward by Judge Rosalie Abella. This would involve:

- Legislated requirements for affirmative action by all employers covered by the Canada Labour Code
- Encouragement of all provincial jurisdictions to follow suit
- Contract compliance action by the federal government and Crown corporations.

We are not convinced, however, that sufficient attention has been paid to the costs of equal employment-opportunities programs or, particularly, to the issues of equity among the various disadvantaged groups in Canadian society.

- We therefore recommend that the program be phased in following:
  - A three year experimental program of affirmative action in Crown corporations
  - Extensive consultations with the private sector to ensure effective but least expensive implementation to begin in three years' time.

This Commission believes that the programs are more likely to be effective if they are supported by legislation and backed by an adequate enforcement agency.

- We therefore recommend:
  - Legislated equal employment-opportunities provisions, rather than guidelines
  - Establishment of fully adequate levels of funding for the federal Human Rights Commission and equivalent provincial institutions.

■ Work schedules are necessarily established on the basis of understandings between employer and employees that will express a balance between the requirements of the work process and the desires of the employee. This Commission has found, however, that some factors exist which may interfere artificially with the achievement of this understanding. Any such factors should be eliminated in order to achieve fuller flexibility of labour-market arrangements, thus enhancing both employee satisfaction and productivity.

- Commissioners therefore recommend such changes as:
  - Basing Unemployment Insurance, Worker's Compensation and CPP premiums on hourly earnings, with a ceiling on contributions that applies to hourly rates rather than to weekly or annual compensation
  - Eliminating the bias against some categories of reduced hours in creating eligibility for paid holidays or termination notice
  - Encouragement of pro-rating of fringe benefits. ☐

Immigration

In the past decade, Canadian immigration policy has become more restrictive than our historical norm, both with respect to numbers of immigrants and with respect to the criteria for admission. We Commissioners do not believe that this narrowing is necessary or appropriate, given the long-term projections for Canada's population growth. We are concerned, however, about the overall implications of a more open immigration policy.

■ We therefore recommend:

- A major examination of Canadian demographic trends and their implications for our government's future immigration policies
- That the same study examine, by means of open debate and other methods, the cultural, linguistic and racial implications of other forms of immigration policy
- Establishment of a long-term plan for immigration that, depending on the results of the study described above, will move to higher numbers of immigrants over a number of years. This new plan should place less emphasis on narrow occupational requirements and more emphasis on broadly skilled and generally capable immigrants. ☐

Labour/Management Relations

■ This Commission notes the very great importance of the labour movement in Canada and throughout the developed world in improving the pay and working conditions of workers. To this end, we wish to recommend generally that all Canadian governments provide a supportive legislative environment for the labour movement and for collective bargaining.

The adversarial system of union-management relations needs to be re-examined. Management must respond to employee concerns about job security and job satisfaction, and to the often-untapped capability of all employees to contribute to improved productivity and product quality. Unions must find new ways to facilitate and to participate in this process; they should have and take the opportunity to do so, not by relinquishing their representation of employee interests, but by adding to it a responsibility for helping to achieve the levels of competitiveness essential to the survival of the enterprise.

Since reductions in strikes and lock-outs could be achieved by the following measures, Commissioners recommend that:

- Labour-relations boards be permitted to create multi-employer and multi-union bargaining units when this is likely to facilitate the bargaining process. Such units should not be imposed but, rather, could be permitted on the application of one or both sides.
- More information be shared by the parties to industrial disputes.

Commissioners are not persuaded that shorter contracts or forced centralization of bargaining structures are likely to improve labour-management relations significantly. Changes in these areas should therefore proceed on a voluntary basis. The right to strike or lock out must be rationally limited by the need to maintain the health and safety of the public.

Employer-employee relations in Canada seem likely to be most responsive to improvement at the level of individual firms, plants and union locals. Overall solutions proposed at the provincial or national level seem unlikely to be as effective as local solutions.

- Commissioners therefore recommend that governments support, on a local and voluntary basis, such features as:
  - Preventive mediation programs
  - Quality-of-working-life programs
  - Gains-sharing/compensation arrangements.

■ Occupational Health and Safety is an area of important and growing concern. Since great improvements can still be made, this Commission recommends:

- Greater emphasis on these issues at higher levels of corporate management. Management failure in this area is bound to result in higher levels of government intervention.
- More complete experience rating of worker's compensation premiums in order to provide direct financial incentives for firms to minimize health and safety problems, in order to ensure that the full social costs of hazardous work environments are reflected in prices.
- Continued and increased reliance on the internal responsibility system rather than increased government intervention. This requires:
  - Mandatory, joint health-and-safety/labour-management committees in all eleven jurisdictions, such as currently exist in nine
  - Vesting real responsibility in those committees rather than leaving them with only an advisory role

- Continual revision of standards by governments as new information about hazards becomes available. This is most important in dealing with occupational health problems. At a national level, these standards could most appropriately be developed by the Canada Centre for Occupational Health and Safety. The appropriate jurisdictions would then apply the standards.

Commissioners are particularly concerned with occupational health issues. Because occupational diseases typically have long incubation periods, it is often difficult to evaluate the effects of industrial processes on workers. That same factor makes it difficult to establish a direct link between occupational factors and specific diseases, and therefore current worker's compensation programs are not well adapted to handling occupational disease.

- In addition to our recommendation of continual development of standards and monitoring of processes, Commissioners also urge that:
  - The federal and provincial governments consider the immediate implementation of a comprehensive social insurance disability plan to deal with the longer-term effects of occupational health problems, as well as with other forms of disability in the working-age population. This plan could be implemented either by expanding worker's compensation into a comprehensive disability scheme or by extending the present disability provisions of the Canada and Quebec Pension Plans. A federal-provincial working party is currently considering this measure, but progress in developing this idea has been slow. □

Education and Training

In Canada education and training programs discharge multiple functions. They constitute an important way in which young Canadians learn to live together in our community, and they are the most important means by which labour-force skills and knowledge are adjusted to labour-market demands. They also provide a major means of upward mobility. Our post-secondary educational institutions are also the major source of basic research and of much applied research, and they are important repositories of our culture.

Commissioners anticipate no diminution in the general importance of post-secondary education and training. Indeed, PSE is likely to increase in importance as the demand grows for high levels of knowledge and research. Training programs, particularly those relating to industrial training, are likely to become more important as Canadians adjust to the shifting realities of the labour market. The Transitional Adjustment Assistance Program, by providing greatly increased support for training, may be a particularly important factor in this adjustment.

Commissioners are concerned about several features of our educational and training system. In particular we are convinced that:

- Higher levels of excellence are desirable and achievable.
- More flexibility is desirable.
- Use of the PSE system by low-income Canadians is insufficient.
- The current federal-provincial transfer arrangements are inappropriate.
- The current balance between industrial and institutional training is still tilted too far towards the latter.
- There is inadequate provision for retraining and re-education in adult years.

With respect to post-secondary education, Commissioners believe that it is desirable to consider substantial changes in financing mechanisms in order to create a more competitive, dynamic and diversified system. The current EPF transfer arrangements are quite inappropriate for achieving those objectives. They should be changed to encourage reform of the system, but in a way that will minimize direct federal intervention in this area of provincial jurisdiction, while still allowing for the achievement of national objectives.

There has been very considerable informal discussion of the intergovernmental transfer arrangements for post-secondary education over the last five years, but there have been no formal federal-provincial negotiations. Commissioners believe that it is important for federal and provincial governments to enter immediately into serious discussion of other methods of funding than the current mechanism both because the present arrangements are less than satisfactory, and because the uncertainty about possible future arrangements may be impeding necessary reforms to the sector. Several broad options are available. Our federal government could:

- Withdraw completely from this sector and cede enough tax points to the provinces to cover its current contributions
- Return to the pre-EPF funding formula
- Provide an amount equal to provincial "own source" funding, exclusive of the tax points transferred under EPF
- Freeze its basic contributions at current or slightly lower-than-current levels while matching on a 50/50 basis incremental provincial spending on education. Alternatively, incremental funding could be earmarked to support high-level university-based research.
- Undertake a form of direct-to-student financing, allowing for variable PSE fee schedules.

This Commission does not recommend federal withdrawal from PSE involvement. Many of the benefits of post-secondary education are national in scope, and provincial governments might tend to undersupply this sector unless there were some federal presence, particularly if they believe that graduates are likely to leave the province. Many representations and briefs emphasized the importance of involvement of the Government of Canada in this field.

Among the cost-sharing options are:

- A return to pre-EPF arrangements. This would be a step back to a basically unsatisfactory system.
- Provision by the federal government of amounts equal to provincial "own source" funding. This move would constitute a massive cut-back by the federal government, part of which would probably be passed on by provincial governments to already hard-pressed institutions.
- Freezing of basic federal contributions with cost-matching of increments. This stance would exert relatively little "leverage" on provincial government expenditures in this sector and would mean starting from a basically unsatisfactory base point. However it is probably the most desirable of the cost-sharing options, particularly if some of the incremental funds are used to support research.

With the possible exception of the final choice, none of the cost-sharing options seems likely to be satisfactory. None is likely to improve the incentives for institutions to achieve the flexiblity and excellence which Commissioners think desirable. We believe that the complex institutional arrangements for PSE have created very considerable inertia in the system, to the detriment of the student and society as a whole. We therefore believe that the direct-to-student/funding option, although it is the most radical and thus difficult for PSE institutions and governments to accept, may be a preferable approach. In order to institute that approach, the following changes would be required:

- The federal government should terminate the PSE cash portion of its EPF grants to the provinces, ceding the EPF tax points plus further equalized tax points in an amount equivalent to the Quebec abatement. All of the cash portion of EPF, including transitional adjustment payments, should be replaced with an education-expense tax credit or grant, to be increased annually at a rate equal to nominal GNP increase.
- Provincial governments should be encouraged to deregulate the fee structure of post-secondary institutions.
- Provincial transfers to institutions might appropriately be based on an equal per-student figure, without differentiation for particular programs, and be related directly to enrolment.
- Students should be responsible for a portion of education costs. Beyond that point, the federal credit should vary with the amount of expenses and tuition fees, up to a limit. The amount of the grant should vary only with fees and expenses directly related to education, and no attempt should be made to direct students into "demand" programs by means of a variable grant structure.
- A portion of the current EPF transfer (and some additional funding) should be reallocated to granting councils, which should begin to cover overhead costs of funded research.

A variant of this approach would provide much higher grants to graduate students than to undergraduates. This approach would greatly increase the "value" of graduate education for institutions and thus encourage specialization and excellence.

■ Commissioners strongly recommend that federal-provincial discussions aimed at rectifying an unsatisfactory situation should begin immediately, that they should consider a range of options such as we have suggested here, and that they should proceed with all urgency toward a conclusion. We believe that close further attention is merited for the options which:

- Replace intergovernmental transfers with direct-to-student transfers. Careful consideration should be given to the variant which makes much larger transfers to graduate students.
- Freeze current federal cash contributions. The federal government would match provincial expenditure increases on a 50/50 basis.
- Freeze current federal cash contributions while redirecting considerable amounts (perhaps one-half) of what would have been the incremental amounts into funding of university-based research. The rest of the funds should be used to match, on a 25/75 federal-provincial basis, larger provincial government contributions to universities.

■ With respect particularly to primary and secondary education, this Commission recommends the formation of an independent national commission to monitor quality and standards in primary and secondary education and to conduct and record research in related areas. We urge that the private sector take the lead in establishing and financing this commission. With respect to occupational training programs, Commissioners believe that the direction of reform presently being followed by the federal government is generally appropriate. Increased attention to on-the-job and job-related training is to be encouraged.

■ This Commission also recommends that the federal government:

- Provide a special wage subsidy for labour-force entrants who have not had other forms of vocational training or post-secondary education. The subsidy would normally be provided to persons 15 to 18 years of age and to women entering the labour force after discharging family responsibilities. The subsidy could be financed by eliminating other job-creation programs for young people.
- Provide, under the Income Tax Act, for a Registered Educational Leave Savings Plan which workers could use to help finance the cost of training. Careful consideration must be given to the type of program eligible for RELSP financing and to the possibility of requiring completion of any training or education undertaken in order to qualify for the advantage.

Commissioners wish to point out that the TAAP described earlier might significantly increase training requirements in Canada.

Access to higher education by low-income students should be an important avenue of upward mobility in Canada. However, for a variety of reasons, low-income students make far less use of higher education than do middle-income students, thus impeding both their own upward mobility and Canada's labour-force efficiency. Several of the barriers faced by low-income students are not susceptible to immediate government reduction. Family-socialization patterns and peer pressures can be influenced only very indirectly. But governments can and should ensure that undue financial barriers are not blocking the educational prospects of low-income students.

> ■ This Commission therefore recommends strongly that further attention be paid to improving access for low-income students. At the least, therefore, we recommend continued support for the Canada Student Loans Program and its provincial equivalents, and we recommend that loan limits be changed in consonance with other policy changes proposed in this Report, to remove any financial barriers that might exclude otherwise-qualified low-income students. We also wish to emphasize the importance of continuing to grant scholarships for students who excel, no matter what their income level, and of offering bursaries for low- or moderate-income students with above-average grades who might otherwise be reluctant or unable to continue their education.
>
> Commissioners are concerned, however that the CSLP is increasingly unable to deal with the issue of student independence of parental support. Therefore we do not reject the concept of contingent-repayment loan schemes, and we recommend that governments continue to consider that possibility. □

Income-Security Programs

While this Commission does not view Canada's problems over the next quarter-century as unmanageable, Commissioners do believe that many – perhaps most – Canadians will have to face the need to make adjustments that will maximize their own opportunities in the face of the effects of economic change. For most Canadians, these adjustments will not be severe, but for some they will be very difficult. This is particularly true for low-income Canadians, families with children that lack income adequate to meet family needs, and workers in peripheral regions or peripheral jobs. Economic change has always caused these Canadians more difficulty than middle-income Canadians, and it will continue to do so. Moreover, even without the impact of change, there are over one million Canadian families whose incomes are inadequate to cover any but the barest necessities, and many of these can be considered the "working poor": families where one or more breadwinners are employed all or most of the year, but where incomes are still inadequate to meet their needs.

Middle- and upper-income Canadians get a great deal of public and private support as they adjust to economic change. They receive tax-supported education and training, and their employers often foot a substantial portion of their adjustment costs. Low-income Canadians receive relatively little such support. In general, it often seems true that the poorer one is, the more one is left to one's own devices to cope with the forces of change or destiny.

For these reasons, among others, Commissioners believe that all Canadians have a duty and a right to share the costs of adjustment and to provide help to those who need it. That has always been the basic rationale for many of Canada's income-security programs, and it should remain so.

We Commissioners are also persuaded that there is enough money in our current personal tax-expenditure and transfer-payment programs to provide a comprehensive program of support for all deserving Canadians, but that current programs are often fundamentally flawed so that the current safety net is inappropriate. We believe that Canada can do much better than it has done in providing income support for our working poor and for those undertaking adjustments in their own lives in order to build a better future for themselves and their children.

■ The Transitional Adjustment Assistance Program would go some way towards providing assistance, but other reforms, too, are required. Thus Commissioners believe that the provision of a Universal Income Security Program with a universally available income guarantee, subject to reduction at a relatively low "tax-back" rate, constitutes the most appropriate foundation for Canada's income security programs.

- We therefore recommend that the UISP replace existing federal tax and transfer programs including:
  - GIS
  - Family Allowances
  - Child Tax Credits
  - Married Exemptions
  - Child Exemptions
  - The Federal Share of CAP Social Assistance Programs
  - Federal Social Housing Programs
- The replacement of these programs would make possible a universally available guarantee, in 1985, of approximately $2750 per adult (and for the first child in a single-parent family) and $750 per child with benefits reduced at a 20-per cent rate as other income was available. The elderly should receive an enriched option. A substantially larger guarantee of $3825 per adult could be provided if the personal income-tax exemption were also included.
- The UISP should be put in place at the same time as the broad Unemployment Insurance reforms described above. The entire package should be in place in 1988. The package should be phased in, however, with a two-stage approach. In the first stage, which should begin immediately, the Family Allowance, Child Tax Credit, and Child Tax Exemptions should be eliminated and replaced with a single demogrant or tax credit of

approximately $1000 per year in 1985, payable monthly. The total amount should be available to families with a total annual income of up to $26 000. Beyond that level, benefits might be reduced at a 25 per cent rate. Experience rating for UI should also begin immediately, and social assistance payments under the CAP should be restructured to replace the present pre-emptive reduction of benefits above the current work-related/expenses level with a 50 per cent reduction rate. At the second stage of implementation, to be completed by the beginning of 1988, the full range of UI, UISP and TAAP changes outlined above should be in place.

Commissioners wish to emphasize that recommended benefit levels and structures are indicative only. While we believe them to be correct and appropriate levels in mid-1985, they will change with time. Moreover, the interrelationship among such features as basic guarantees and tax-back levels can be varied to achieve a number of effects.

We also wish to emphasize that while the federal government could implement most parts of this proposal unilaterally, these reforms are likely to be far more effective if they are carried out in co-operation with provincial government changes. The major reason for this is that provincial governments automatically receive larger tax revenues whenever the federal government eliminates tax exemptions and deductions. If the full value of these programs is to be maintained for the social policy sector, it will be necessary for the provincial governments either to provide harmonized transfers or to cede some tax points back to the federal government in return for delivery of the income-transfer arrangements.

- Commissioners recommend therefore, that these proposals be the subject of urgent and serious federal-provincial discussion. We urge the Government of Canada to introduce them to the federal-provincial agenda at an early federal-provincial ministers' meeting and to move forward quickly towards implementation.

The UISP is not intended to provide fully adequate benefits for all Canadians who have no other earnings or income; it is primarily a supplementation program intended to compensate for the fact that there is often a considerable mismatch between earnings and needs. Commissioners therefore recommend that provincial governments continue to provide needs-tested social assistance as a top-up to UI and UISP benefits where these do not fully meet pertinent needs. The equivalent of the current provincial share of social assistance payments should be adequate for this purpose. In addition, provincial governments could reap a substantial increase in tax revenues from some of the tax changes which would accompany the inception of the UISP. It is desirable that these funds should also be used to support income-security programs; that arrangement would make provision of topping-up arrangements financially easy.

The UISP seems to Commissioners to be the essential building block for social security programs in the twenty-first century. Should governments not be able to implement it, a series of less complete reforms would at least ameliorate some of the worst features of the existing systems.

- Thus, failing the implementation of the UISP, Commissioners recommend:
  - Reform of the family-benefits program to reduce or eliminate the child tax exemption and the family-allowance program and to increase the child tax credit, which should also be made payable on a monthly basis
  - Reform of social assistance provisions of the Canada Assistance Plan to eliminate pre-emptive taxation of social assistance benefits as other income from employment, training allowances or similar sources is received. ☐

We wish to emphasize that these are partial reforms only, and that the more comprehensive UISP is a preferable choice.

Social Services

This Commission did not undertake an extensive review of Canada's social service programs. We did, however, receive many representations about them, and we did develop several recommendations.

■ Commissioners support the continuing devolution of responsibility for delivering social services to the community level and to non-profit associations. We strongly recommend, however, that this devolution not be handicapped by a reduction in funding, and that governments retain sufficient staff to exercise their monitoring responsibilities. The maintenance of funding is particularly important, since we could see no evidence whatsoever that social services, which include support for children, the elderly, the disabled and those with shorter-term social problems, are overfunded. Indeed, considerable evidence of underfunding was presented to us in our hearings.

- The major social services will also benefit from:
  - Further forms of assistance which will help users to become more self-reliant
  - Better integration of various forms of social and medical services at the community level

Access to many social services in Canada is now impeded by the "needs-based" approach of the Canada Assistance Plan. Only those "in [financial] need or likely to become in need" have free access to services, so that many Canadians just above the poverty level are effectively precluded from receiving such important support as family, marital and financial counselling or child-support services.

■ This Commission recommends that the current federal-provincial financing arrangements be severed from social assistance financing and renegotiated to provide Canadians with broader access to these services.

■ This Commission is not persuaded that extensive delegation of responsibility for social services to the profit-seeking part of the private sector is likely to improve significantly the services provided to Canadians. Where such privatization is practiced, we recommend that it be done in the context of very careful government regulation of the provision of services. Profit maximization, in our view, is not always the best motive whereby to govern human transactions.

There are currently two major task forces working at the national level to review day care in Canada; therefore this Commission has not conducted research in this area. Commissioners do, however, wish to note that the current CAP day-care guidelines actually serve to make access to publicly supported day care quite difficult for middle-income Canadians, and that the current $2000 tax exemption for child-care expenses is much more valuable to upper-middle/class Canadians than to the majority of Canadian families. Both these provisions require reform.

■ Finally, Commissioners wish to pay tribute to the hundreds of thousands of Canadians who work through the voluntary sector to help their fellow citizens. We recommend that all levels of government should continue to support and nurture such activity by providing fully adequate support and supervision for the programs dispensed through the voluntary sector. □

PART VI

The Institutional Context

Conclusions and Recommendations

The more government Canadians have, the more democratic we must become. The institutions of responsible parliamentary government remain the key to keeping government our servant rather than seeing it become our master. Commissioners regard Parliament as the principal forum for public debate and intend our recommendations to contribute, in general, to the strengthening of this institution.

To restore Parliament as the principal forum for national debate, we must not only bolster its democratic processes, but we must also improve its capacity to reconcile national and regional interests. We wish neither to reassert the dominance of the national government in line with the prevailing opinion at the time of Confederation, nor to establish the provincial order of government as an integral part of national government.

With regard to federalism and intergovernmental relations, two basic needs influence Commissioners' general objectives. First, it is desirable to clarify where possible, by constitutional amendment, by delegation or intergovernmental agreement, or by more clearly defined policy directions, the responsibilities distributed between federal and provincial governments. Secondly, recognizing the complexity of modern government and the interdependence within our federation, it is desirable to introduce greater certainty and stability into existing intergovernmental processes. We seek neither to eliminate intergovernmental conflict nor to further the development of non-accountable institutions. Rather we seek to secure and give greater public recognition to minimal processes and structures that will moderate the excesses and costs of unresolved conflict and channel creative solutions to common problems.

Commissioners view the Charter of Rights and Freedoms both as a guarantee of specific rights and freedoms of citizens and as an important element of the framework within which Canadian society can evolve. This is consistent with our view that constitutional law should be responsive to social change and evolving values and attitudes, and that it should stabilize the pace and direction of such change.

Responsible Government and Public Accountability

■ The Canadian practice of party government has restricted the opportunities for Members of Parliament to participate in the development of public policy outside the confines of party caucuses. Organized special interest groups now challenge MPs as representatives and frequently bypass them.

- MPs could gain more influence over public policy if members in committee could investigate and debate matters of public interest on which party positions have not yet been established or fully determined. The separation of legislative committees from investigative committees would help to achieve this end by serving to provide Parliament and the government with policy analysis and guidance distinct from that which is received from administrative officials or extra-parliamentary sources.
- Parliament need not diminish the activities of interest groups, but it should provide the principal public forum for these interests to define their concerns. Parliament should encourage these groups to present their positions and demands for an open examination in relation to general interests. There should be a small number of parliamentary committees focusing on comprehensive policy matters – the budget, regulatory policy, Crown corporations, and federal-provincial relations, for example – and these would be ideal forums for such scrutiny.
- Agencies such as the Public Service Commission, the Office of the Commissioner of Official Languages, the Privacy and Information Commissioners and the Office of the Auditor General have important functions, but receive insufficient direction and control from our elected representatives in Parliament. In order to ensure accountability of these agencies, Parliament must define their procedures and basic strategies. Commissioners suggest that the Public Service Commission, the Office of the Commissioner of Official Languages, and the Privacy and Information Commissioners review their work before a Parliamentary Committee on the Public Service. This committee would study the success of these agencies in meeting the various criteria set by Parliament. The same committee, since it would be familiar with the performance of these agencies, should review their financial estimates. The Public Accounts Committee would perform this role in relation to the Office of the Auditor General.

- The federal government has formalized Cabinet structures, processes and support services in recent years, in order to restore ministerial and parliamentary control over an expanded and complex administrative structure. Although central agencies have partially checked the dispersal and diffusion of power to public servants, they can do so effectively only when under the close direction of ministers; otherwise, central agencies themselves become yet another layer of bureaucracy to be controlled.
- We have given too much autonomy and discretion to non-departmental forms of government organization such as Crown corporations and regulatory agencies. Such autonomy has undermined the principles of responsible government. To correct this situation, Commissioners recommend that greater "control" of Crown corporations be defined in the context of a reformed competition and regulatory environment, and not just in the framework of administrative accountability, in accordance with the current trend. Especially for commercial Crown corporations, governments need greater strategic control, not day-to-day interference in management decisions. Moreover, Cabinet should strengthen its review of regulations formulated by regulatory agencies.
- Although some prominent political appointments have violated the ideal of a neutral public service, it is not true that the senior bureaucracy has become politicized. The system of appointments by Order-in-Council based on professional merit on the recommendation of the Clerk of the Privy Council has worked well. However, political advice to the Prime Minister has traditionally been the basis of appointments to a large number of boards and agencies. This category may be too large; the public might be better served if more of these appointments were based exclusively on merit. An all-party group designated by the proposed Parliamentary Committee on the Public Service should review the current use of Governor-in-Council appointments to boards and agencies, the foreign service, high levels in departments, and Ministers' staffs, in order to help distinguish between two categories of positions: those where partisan sensitivity justifies political appointments, and those where partisan sensitivity is not at issue and where professional merit should prevail. Commissioners' opinion is that this general review process should be continuous, and that appointments of no clear partisan value should be made on a basis of "merit".
- In light of the accelerating challenge to democratic controls presented by the increasing international responsibilities of the state, Commissioners believe it is desirable to provide secure foundations for parliamentary ratification of international treaties and for other measures to ensure parliamentary review of executive action in the international domain. ☐

Representative Government and National Socio-Economic Interests in Economic Policy Formation

It is important to facilitate more direct and continuous involvement of representatives of Canadian interest groups in public decision making, especially in economic policy. Those interests need to interact more with one another and to take greater account of the broader concerns and conflicts within Canadian society for the resolution of which Parliament itself is ultimately responsible.

In comparison with the formal structures that have developed in some Western nations, Canadian consultative practices tend to be fragmented, informal and episodic. Current practices may be inadequate in light of recent Canadian experience and anticipated needs, such as the continuing pressures of economic adjustment. However, we do not recommend a corporatist or tripartite style of government/private sector relations.

■ Although substantial secrecy is necessary in relation to the preparation and release of the budget, Commissioners recommend that guidelines are needed to allow less comprehensive budget secrecy than now exists. We urge the House of Commons to initiate a change in the convention of comprehensive budget secrecy in order to set in motion steps towards more effective advance discussion and consultation arrangements.

It would be desirable to seek federal-provincial agreement on the timing of budgets, so that their presentation could be co-ordinated, with the federal budget either preceding or following most provincial budgets by two or three months. Pre-budget consultation should occur in several forums, but particularly in the House of Commons.

A continuing national dialogue on general directions for economic policy requires a permanent national forum. This Commission favours establishment of a permanent Economic Policy Committee of the House of Commons. The Committee would hold an annual series of pre-budget hearings timed to allow its work to influence budget preparation. It would take testimony about the nation's economic prospects from the Department of Finance, the Bank of Canada, and the Treasury Board, as well as from agencies such as the Economic Council of Canada; it would also gather the views of major groups, including national representatives of business, labour and other associations.

The Committee would scrutinize the government's performance and the revenue and expenditure implications of the positions of key interests. It should schedule its budget review to co-ordinate with its other responsibilities and with the timing of the annual First Ministers' Conference. Moreover, it would be necessary to adjust the internal priorities and planning cycle of the federal government in light of the accepted federal-provincial cycle.

Continuation of sectoral and industry-by-industry dialogue on improving Canada's economy is essential. Discussions should bring together representatives of business and labour, and federal, provincial and municipal governments and other groups, as necessary. Government participation may not always be required. In light of these conclusions, Commissioners recommend that such sectoral discussions be developed within the following guidelines:

- Consultative mechanisms should focus on clear, specific objectives. This approach will make them more likely to be successful.
- Consultation should be a continuing process with reasonably predictable arrangements. Permanent or standing groups may be required in some cases.
- Governments must make a firm commitment to any consultative process they undertake. Effective consultative arrangements require that non-government participants have some influence on the agenda and decision-making schedule. Responsibility for the overall policy-making process, however, rests with the government of the day.
- Consultative processes aimed at consensus building must be supported by fair representation from many groups in society and, normally, by parity between business and labour.
- Sharing and refining of information are prerequisites to these consultative processes. □

National Institutions and the Representation of Regional Interests

Commissioners believe that the federal principle requires that the House of Commons, chosen on the basis of representation by population, be balanced by a second chamber based on representation by region. Our institutions should recognize the federal principle, provide greater regional representation, and respond to regional interests in national policy making and administration.

■ Commissioners recommend that the Senate embody the federalist principle and provide the regional representation lacking in the House of Commons.

- A reformed Senate must build on our practice of party government in its elections, caucuses and discipline. The Senate must be elected, and election to the two Houses should take place at the same time.
- In the Senate, representation should be weighted in favour of the less populous regions. All regions need not be considered equal, for the Senate should only temper, not obstruct, representation by population.
- The Senate should be elected by a system of proportional representation. The governing party is more likely to have elected representatives from all regions within its parliamentary

caucus, even if, for one or some regions, they secure places only in the Senate. A Senate elected on this basis should ensure that the governing party will usually be able to constitute a Cabinet that includes members from all regions.

- We recommend that Senators be elected in six-member constituencies. This number is large enough to effect the intended proportional representation and yet to allow for some recognition of the regions within provinces. Yukon and the Northwest Territories could elect their Senators on simple plurality. Existing numbers of Senators would be modified and distributed as follows:

	Existing	**Proposed**
British Columbia	6	12
Alberta	6	12
Saskatchewan	6	12
Manitoba	6	12
Ontario	24	24
Quebec	24	24
New Brunswick	10	12
Nova Scotia	10	12
Prince Edward Island	4	6
Newfoundland	6	12
Yukon	1	2
Northwest Territories	1	4
	104	144

- The Senate does not require a veto to temper, on regional grounds, the legislative majority of the House of Commons. Commissioners believe that the Senate should have a six-month suspensive veto, except in relation to legislation with linguistic significance; such legislation would require approval of a majority of francophone Senators, as well as of the Senate as a whole.
- If Senate reform along the lines proposed here is not adopted within a reasonable time, efforts should be made to reform the electoral system of the House of Commons to enhance regional representation. In that event, Commissioners favour the proposal of the Task Force on National Unity to add 60 members to the Commons, distributed to parties on the basis of their share of the national popular vote and allocated to provinces on the basis of the degree to which the parties were "underrepresented" in seats won, or not won, in relation to their share of the popular vote in each province.

Many federal departments and agencies have not assumed responsibility for regional development within their mandates. This failure has lessened the executive branch's capacity to be regionally responsive and has undermined the effectiveness of regional representation in Cabinet.

- This Commission therefore recommends that:
  - The central administrative agencies should be structured so as to provide more regional information upon which the Cabinet

can base policy decisions. This requires that regional offices be part of the central agency apparatus supporting the Cabinet and the Prime Minister.

- The Cabinet should decentralize departments and agencies for purposes of policy planning and development. Sectorally organized departments should incorporate the regional dimension fully in departmental planning and policy development. There should be regional officials in the central administrative decision-making of departments.
- Regional representation should receive consideration in nominations to the boards of Crown corporations and regulatory agencies. If the Senate becomes an elected body, appointments of the heads of major Crown corporations and all members of the governing boards of major regulatory agencies should be subject to the approval of a Senate committee to be established for this purpose. ☐

Barriers within the Canadian Economic Union

Despite recent expressions of concern that the Canadian economic union is becoming increasingly balkanized and fragmented, goods, capital, services and people now move relatively freely within the Canadian common market.

While lost economic output from impediments to free movement and distortions of the common market appears small, private economic actors have indicated that the policies in question create considerable difficulties for them. Even more than the economic rationale, the political rationale for the national right to free movement is a powerful idea for most Canadians.

The effect of these distortions – and the need for effective co-ordination of economic policy – are likely to increase as Canadians face greater competition from the outside world. We should create incentives to international competitiveness, and we should facilitate appropriate adjustments.

The economic union implies elimination of internal barriers and positive measures to facilitate operation of the market, to overcome market imperfections and to pursue effective stabilization, industrial and social policies. All regions must share in the benefits of economic integration.

Internal barriers may be the response of governments to local preferences, and often reflect our commitment to redistribution of income and opportunity. Thus, the challenge, in particular cases, is not simply to eliminate the barriers through constitutional prohibition or other means, but rather, how to balance the economic benefits of free movement against other goals to which Canadians aspire. The trade-offs to be made are not exclusively between economic efficiency and political diversity or provincial autonomy within the federation: Canadian federalism also involves a national community with its own requirements. Moreover, as the Canadian Charter of Rights and Freedoms makes clear, individual rights have implications for the economic union.

The goal of regional development requires that Canadian economic policy must seek not only to maximize aggregate national income, but also to encourage the economic development of individual regions.

■ Commissioners urge that a broad view be taken of the scope of section 121 of the Constitution Act, 1867, consistent with an interpretation that section 121 covers services as well as goods, and non-tariff barriers as well as tariffs. However, in light of existing controversy and uncertainty, it may be prudent to seek eventual clarification by constitutional amendment.

- We would recommend a limited amendment to include services to reflect current conceptions of the nature of interprovincial trade. On the issue of non-tariff barriers to trade in goods and services, we recommend as an interim step that governments agree to a Code of Economic Conduct.
- The governments of Canada should develop a Code of Economic Conduct to spell out acceptable practices, set out the principles of the economic union, and provide for enforcement. We advance a series of general guidelines for consideration:
  - The code should confirm general principles of the economic union applicable to both the federal and provincial governments:
    - Reduction of barriers to the allocation of capital, labour, goods and services throughout Canada
    - Non-discrimination against persons (individuals and organizations) based on province of residence
    - Commitment to minimizing the costs of provincial programs that might fall on the residents of other jurisdictions, and to prior consultation for this purpose
    - Recognition of the need for a transportation, communications and information infrastructure to support national economic development with significant regional benefits.
- The burden of demonstrating that a barrier did not violate the principles of the Code should lie with the authority imposing the barrier.
- The Code should identify major areas where reduction of barriers to internal trade should begin. Attention should focus not only on the form of the barriers, but also on the anticipated effects. The possibilities of substitution between types of barriers are extensive, and provinces vary in economic development and in their potential to inflict injury on other jurisdictions or the residents of those jurisdictions. Those drafting the Code might first consider barriers that prevent Canadian enterprises from being internationally competitive.
- Initially governments should set up the Code, and public and governmental pressure should enforce it. The intergovernmental process would provide the appropriate forum for dealing with the politically sensitive issue of internal barriers to trade. After

experience with the operation of the Code, we should move to entrench its principles in the Constitution and to enforce the Code through some other form of binding intergovernmental agreement.

- To develop the Code of Economic Conduct, monitor the state of the economic union, and explore methods for co-ordinating policies, the First Ministers' Conference should create a Council of Economic Development Ministers.
- To initiate the process of identifying and controlling internal trade barriers, Commissioners propose the following procedure. The Council will ask each government to list barriers imposed by other governments that they believe harm its provincial economy or its residents. Next, each government would be required to explain and defend those of its policies identified at the first stage. A Federal-Provincial Commission on the Economic Union would receive this material and would analyse the barriers, their probable consequences, and the justifications declared. The Commission would identify violations of the principles of the economic union and make recommendations concerning specific terms for the proposed Code. It would send this report to the Council for action.
- A Federal-Provincial Commission on the Economic Union which would serve the Council of Economic Development Ministers would have responsibility for preparing materials for the Council as directed:
  - Analysing the first round of barriers identified by the Council's initial inquiry
  - Initiating research on the state of the economic union and methods for improving it
  - Receiving complaints from groups, individuals and corporations affected by government actions threatening the economic union, investigating them, and reporting on them, with recommendations, to the public and the Council.

If a Code is eventually made legally enforceable, the Commission could become a regulatory agency, but one that regulates governments. □

Economic Management

In several specific areas related to our concern with the international environment, the Canadian economic union, and economic adjustment, Commissioners believe that constitutional changes are desirable for more effective economic management; Canada requires a procedure which would allow treaties, once concluded, to be binding and enforceable on both federal and provincial authorities within Canada.

■ We recommend a constitutional amendment to provide that where a proposed treaty contains provisions that require implementation by provincial legislatures or affect rights within areas of provincial jurisdiction, the relevant sections should be ratified by provincial legislatures. We propose the application of the amendment formula for this purpose so that sections of a treaty imposing obligations on provinces would come into effect on the passage of resolutions in the legislatures of two-thirds of the provinces, representing at least half of Canada's population. We do not see this recommendation as having immediate application to negotiations with the United States on a free-trade agreement. We would recommend, however, that a constitutional solution be in place before the proposed trade agreement would come up for review in the 1990s.

■ To clarify jurisdiction and roles in the field of telecommunications, we recommend concurrent jurisdiction with federal paramountcy.

■ To clarify responsibility regarding certain aspects of overall regulation of trade and commerce, we propose that section 91(2) be amended to provide explicitly for federal regulatory power over competition and product standards.

■ If intergovermental agreement is not reached soon on the harmonization of regulations respecting interprovincial trucking, we recommend that serious consideration should be given to bringing this matter under federal jurisdiction. ☐

Equalization

The principle of equalization, an essential element of Canadian federalism, represents a commitment to all provinces that economic misfortune will not undercut their constitutional role. It contributes to a true decentralization of government functions, in spite of the differing economic capacities among provinces.

Commissioners stress the distinction between equalization payments and regional development programs. The former are intended to offset economic disadvantages, while the latter are intended to reverse this disadvantage. Equalization payments are necessary only because of our lack of success in combatting regional economic disparities. In practice, this means that regional development financing must be added to equalization disbursements; the federal government should not cut one in favour of the other.

■ The federal government's responsibility for interregional redistribution gives it a leading role in designing and operating the equalization scheme. Commissioners recommend that the following changes to the equalization system be discussed with the provinces:

- Canada should return to a representative tax system that includes all 10 provinces in the base. The present five-province calculation base allows too much room for distortion, strategic behaviour and unintended side-effects.

- Equalization payments should include some portion of resource revenues. There is no magic figure here, but the 20 to 30 per cent range seems an appropriate compromise, since it approximates the amounts that would accrue to provincial treasuries in the form of tax revenues if natural resources were in private hands.
- The concept of including needs as part of the entitlements calculation is attractive. Commissioners recognize, however, that this can develop only slowly, given the amount of data required and the serious practical difficulties involved. The inclusion of needs in the calculation will be especially important if the Northern territories enter the scheme. □

Regional Development

This Commission believes that regional development must remain an essential component of Canadian policy and, indeed, of the Confederation bargain as now reflected in section 36 of the Constitution Act, 1982. It must be recognized, however, that policies intended to promote regional development have often hindered the overall efficiency of the national economy in that they impeded inter-regional adjustment and distorted regional development. Canadians need to reconsider the way in which we look at regional economic disparity, what we do to overcome it, and the institutional mechanisms we bring to the task.

■ We recommend a new federal-provincial system of sharing regional development expenditures and responsibilities.

- The federal government should direct regional development programs toward improving regional productivity and the efficiency of the labour market. To these ends, such programs should include measures to improve worker and management skills, enhance research and development efforts, ensure a high level of infrastructural support, and supply assistance for intra- and inter-regional mobility. The federal government should not only provide such programs on a national basis, but should also make a special effort in the less developed provinces. While it might make sense, too, for the federal government to provide assistance for plant modernization as a means to enhance regional productivity, we believe that it should provide this type of assistance on a national basis, if at all, or that the provincial governments should take on this responsibility on a regional basis.
- Under this arrangement, the federal government would end all explicit and direct regional employment-creation programs. While national schemes would continue, federal subsidies, tax

breaks, and so on, intended only to generate jobs in, or attract firms to, a particular locale, would be eliminated. Similarly, the federal government would terminate regionally differentiated unemployment-insurance programs, tax credits, and other measures that tend to distort regional labour markets. Funds formerly allocated to these types of programs would instead become the source of Regional Economic Development Grants.

- Provinces that qualify for equalization payments would be eligible for Regional Economic Development Grants. The amounts of the grants would be determined by a formula on a per capita basis, and they would be proportionate to the degree of fiscal disparity identified by the equalization formula. As noted earlier, equalization payments are necessary to offset economic disparities, while the purpose of these new grants would be to reduce future disparities. They would be renegotiated every five years.
- Provinces would assume full responsibility for local or place-specific employment measures as part of their own approach to regional development. They would be free to use the Regional Economic Development Grants for this purpose, subject only to two conditions:
  - Each recipient province would sign an Economic and Regional Development Agreement (ERDA) with the federal government, which would set out a broad economic development plan for the province (and for each other province) and would indicate the measures to be carried out by both orders of government. Some elements of these packages might take the form of shared-cost programs or federal contributions to provincial activities; in general, however, Commissioners recommend that under the ERDA umbrella, each government remain responsible for the implementation and delivery of its own programs, in order to enhance accountability.
  - The recipient province would be required to sign the proposed Code of Economic Conduct to improve the functioning of the Canadian economic union.
- While recognizing the immediate need for financial prudence at the federal level, Commissioners believe that the total federal financial commitment to regional development – combining the Regional Economic Development Grants and other funds spent through ERDAs – should increase significantly over the next few years.
- The federal government would continue to play an important role in other development efforts which have significant regional impacts such as:
  - A reformed equalization system
  - The proposed Universal Income Security Program and the Transitional Adjustment Assistance Program

  - Sectoral policies, such as those pertaining to fisheries, agriculture, and forestry. These should be designed according to criteria for good sectoral policy (see Parts III and IV of this Report), but they ought to also be developed in close consultation with provincial governments where these are affected to an important degree.
- A sustained federal commitment to regional development requires that a single central agency be responsible for injecting regional concerns into the programs of individual federal departments, and for co-ordinating federal efforts. It would appear to Commissioners that the Federal-Provincial Relations Office (FPRO) reporting to the Prime Minister, would be the appropriate existing body. We believe also that the Federal Economic Development Co-ordinator (FEDC) or other senior officials resident in each province could help to co-ordinate federal activities within each province, interacting with the provincial government and establishing links with local economic interests. The federal government should enlarge the responsibilities of such federal regional officials, who should report directly to FPRO. ☐

Fiscal Arrangements

Tax Collection Agreements

The Tax Collection Agreements have served Canada well. They are convenient for both citizens and governments, and they help to maintain harmony and contribute to the strength of the economic union. They should be retained. Nevertheless, the agreements are presently under considerable strain, and are in some danger of disintegrating. This Commission's proposed reforms are based on the desire to maintain the agreements, but not at an excessive cost either in terms of the accountability of legislatures or in terms of the flexibility which exists in the system.

■ Commissioners therefore recommend that:

- The agreements be amended to place the personal income tax on the same footing as the corporate tax, applying the provincial rates to the common, federally determined base. This measure would not only reduce provincial vulnerability to federal tax changes, but would also enhance provincial autonomy, since it would become easier for provinces to decide how progressive their own tax rates should be.
- The federal government consult with provinces before introducing any tax change which would have a significant effect on the federal-provincial relationship. This recommendation is consistent with Commissioners' larger concern to reduce budget secrecy for federal and provincial governments and to ensure that federal budget proposals receive wide discussion in Parliament.

- To provide greater consultation on taxation matters of a more fundamental nature, Commissioners recommend that a new federal-provincial Tax Structure Committee be given the following mandate:
  - As part of the regular process of the quinquennial review of federal-provincial fiscal arrangements, the Tax Structure Committee would re-examine the definitions of taxable income, basic exemptions, marginal tax rates, and the like. This is really an endorsement and extension of a consultation process which is already in effect. The Tax Structure Committee would also monitor the division of tax room between the two orders of government, in light of anticipated revenue and expenditure needs, and of the difficulties of managing restraint.
  - As part of the overall concern for the economic union, the Tax Structure Committee could also discuss the implications of federal or provincial tax credits and subsidies. It would thus assist the Council of Economic Development Ministers which, we propose, be responsible for the development of an overall intergovernmental Code of Economic Conduct. This Committee would be composed of representatives of all governments, including those now outside the agreements. ☐

The Spending Power and the Impact of Fiscal Restraint on Intergovernmental Transfers

Although Commissioners do not recommend formal limitations on the spending power, we consider that this power has important consequences for federalism and therefore should be exercised with special restraint and subject to certain guidelines concerning its use.

■ Commissioners thus recommend that the spending power be retained as a vital instrument for flexible responses to changing definitions of the national interest, subject to the conditions that:

- The judicial distinction between federal legislation providing grants or gifts and federal legislation involving direct regulation in fields of provincial jurisdiction is appropriate and should be further refined.
- As a matter of principle within the federation and for purposes of accountability and clarity of roles, the federal government regard new shared-cost programs as a last resort in pursuing its objectives.
- The use of the federal spending power in areas of provincial jurisdiction be supported by broad national consensus. In addition to the contribution to consensus which an elected Senate with stronger regional representation will make, consultation through the Federal-Provincial Ministerial

Councils and, ultimately, the First Ministers' Conference is essential, not only in relation to new programs, where it will occur in any case, but also in relation to the proposed alteration or termination of a program by the federal government. Designated periods of operation of, say, five years, could be considered for program renegotiation.

- In order to retain a desirable degree of federal flexibility and accountability to Parliament while assuring provinces some stability for planning and protection against rapid unexpected variations in federal spending, we recommend that:
  - Federal-provincial transfers be subject to a review on a five-year basis.
  - During that period, the federal power to make adjustments be limited to, say, 5 per cent in any given year, without provincial approval. □

Intergovernmental Relations and the Institutions of the Federation

The intense intergovernmental conflict Canada experienced in the 1970s may be partly attributed to institutional limitations. Interdependence in modern federalism is inescapable and needs to be managed, as do the excesses of intergovernmental competition.

This Commission's goal is to encourage a more functional approach to federalism, one not oriented towards centralization/decentralization, but one which emphasizes the potential contribution of Canada's federal arrangements to the well-being of Canadians. Canadians should create political institutions to co-ordinate activities involving both orders of government.

While greater co-ordination of federal-provincial affairs would be desirable, Commissioners believe that the diversity of government action inherent in a federal state is also a positive contribution to society. Thus we have tried to strike a balance between encouraging institutional diversity or competition and proposing new measures of federal-provincial co-ordination.

■ Commissioners do not recommend comprehensive constitutional amendment as a means to modernize the division of powers. Instead, we urge the use of more flexible instruments to clarify or transfer the location of responsibility. To this end, we recommend that:

- The power of intergovernmental delegation be expanded so that on a particular matter, law-making authority could be delegated to another jurisdiction. Such delegations should be approved by the legislatures of all jurisdictions involved
- Constitutional amendment be used to establish a procedure that would permit the Parliament of Canada and provincial legislatures to enter into intergovernmental agreements that would be binding on their successors

- The powers of reservation and disallowance, now by convention virtually "dead letters", be formally interred by means of an appropriate constitutional amendment.

■ To provide essential recognition of the need to manage intergovernmental interdependence, and the need to co-ordinate policies and activities, the First Ministers' Conference should be established in the Constitution with the requirement that it meet at least once each year. Such an institution must in no way encroach on the principles of responsible government.

■ First Ministers may eventually wish to consider the creation of a body comparable to the Advisory Commissions on Intergovernmental Relations in the United States and in Australia. "Third parties" of this nature may facilitate behind-the-scenes resolution of intergovernmental conflicts and contribute to improving the context of information, analysis and public opinion to which the intergovernmental process will need to respond.

■ Despite a plethora of federal-provincial bodies, current intergovernmental discussions are sporadic and lack co-ordination. Our purpose is to suggest a core framework of federal-provincial mechanisms which, in a more streamlined way, would support the First Ministers in their collective and individual responsibilities. Commissioners propose that the First Ministers' Conference appoint a network of Councils of Ministers to serve in major functional policy areas and to be supported by continuing committees of officials. We believe that three central Ministerial Councils should be established in the fields of Finance, Economic Development, and Social Policy. We therefore recommend that:

- The *Council of Finance and Treasury Ministers* which now exists and meets from time to time regarding fiscal arrangements, economic projections, and macro-economic policy be formalized to encourage greater regularity of assembly, better co-ordination of budgetary preparations, and to receive the findings of the new Tax Structure Committee, which would monitor tax developments
- The *Council for Economic Development* seek agreement on common objectives in economic development and trade policies and identify opportunities for mutually beneficial links among regions. The Council would be responsible for monitoring and assessing the state of the economic union and would serve as the vehicle through which to develop a "Code of Economic Conduct".
- The Ministerial *Council on Social Policy* consider all facets of social policy, especially in the fields covered by Established Programs Financing and the Canada Assistance Plan. Consultation with practicing professionals and interested groups and individuals is particularly important in this area. We would

encourage Parliamentary Committees to play a stronger role in this activity.

- To ensure that governments are held accountable for their conduct of intergovernmental affairs, Commissioners recommend that Parliament and the provincial legislatures should establish permanent standing committees responsible for Intergovernmental Relations. ☐

Differing provincial regulations create inconvenience for those who wish to operate nationally. The impetus for interprovincial efforts towards harmonization must arise through the pressure of groups adversely affected by interjurisdictional variations. Commissioners therefore propose no specific institutional changes designed to enhance harmonization of provincial laws.

The Charter of Rights and Freedoms

The Charter and Constitutional Government in Canada

The Charter of Rights and Freedoms signals a significant transformation of the relationship between citizens and the state in Canada. Most noteworthy are the important limitations imposed on the constitutional authority of legislatures and the elevated role of the judiciary as guardians of the constitutional rights and freedoms of individuals. The Charter will also further the rights of citizens to review and assess government actions, and it will contribute to a fuller and more regular discussion of citizen rights in Parliament. Its guarantees will probably become the basis for individuals and groups to introduce issues to the national and provincial political agendas.

The scope and application of the Charter will be tested constantly through both the legal and political processes. The Charter is not, however, a springboard for unlimited claims of citizen rights, for there are reasonable limits to its guarantees. Ultimately, its effectiveness in protecting the rights and freedoms of citizens and in enhancing democracy will be determined by the way in which citizens use this document.

- This Commission believes that the changes recorded and introduced by the Charter should be given a broad scope in interpretation and application. Departures from its guarantees should meet stringent tests and conditions, justifying the circumstances of exception.

- The Charter's general override provision should contribute to public awareness of legislation limiting the constitutional rights of citizens in Canada. Overriding legislation should include a declaration of intent to legislate, notwithstanding a provision of the Charter, and should include not only reference to the specific rights being overridden, but also an indication of the purpose of such legislative action. Such a statement of purpose would help the courts to ensure that limitations do not exceed what is necessary to achieve their objective; it could also be a useful reference point in discussions on whether to extend the override after the five-year period.

■ **Commissioners do not suggest constitutional amendments to change and improve upon the Charter's words. Rather we consider various interpretations of the Charter which we think will serve to maximize the desirable impact it can have on Canadian society. Two examples illustrate our approach:**

- **We favour a broad and flexible application of the Charter at the periphery of government activity, as well as in its more visible legislative forms.**
- **Similarly, in the matter of the Charter's guarantees of personal mobility rights, we conclude that preferential provincial employment schemes permissible under the Charter should be strictly limited to the socially and economically disadvantaged within a province. Such programs should not preclude the federal government from simultaneously pursuing employment-opportunities programs in that province.**

Inherent in the Charter of Rights and Freedoms is an attempt to overcome some of the problems of national unity that have pre-occupied Canadians since the mid-1960s. This is especially evident in the Charter's provisions respecting mobility rights, official languages and minority official-language education, as well as multiculturalism.

With regard to ethnic diversity in Canada, Commissioners believe that multiculturalism policy should seek to create circumstances that permit all Canadians to preserve and enhance their cultural heritage within the broader Canadian tradition of individual equality. Multiculturalism is not a justification for cultural or racial discrimination. For visible minorities, in particular, racism must be addressed through more than multicultural policy. There is a systemic aspect to racial discrimination in Canada. As with other pattterns of systemic discrimination affecting groups such as women, the handicapped and other identifiable groups, the Charter plays an important role as both an educative and legal instrument in enhancing equality.

The Charter's equality-rights guarantees embody a broad definition and understanding of equality. These guarantees reflect contemporary notions of substantive equality in giving assurance of equal benefit of the law and equality under the law. By enabling affirmative action programs, the Charter responds to contemporary concerns about discrimination against various groups in society.

■ **Commissioners believe that governments have a leadership role to play in breaking down these patterns of discrimination and we believe, too, that affirmative action is a valuable tool for this purpose. Accordingly, we view the provision in the Charter enabling governments to pursue affirmative action programs as a valuable reinforcement of government's role. Equality, however, must ultimately relate to individuals, and affirmative action must be supplemented with other programs designed with individual equality as the ultimate goal.**

■ The Charter both contains guarantees of individual equality and elsewhere recognizes special rights of various groups, such as official-language minorities and Canadian aboriginals. We believe that when group rights are inconsistent with rights of individual equality, the latter, as a general rule, should prevail. □

The Supreme Court of Canada

The members of the Supreme Court of Canada do not perform representative functions in the Canadian institutional and constitutional system. Judicial merit alone is the criterion by which the Court's membership and performance should be assessed. Accordingly, Commissioners reject arguments that the composition of the Supreme Court should be regionally representative. Existing provision in the Supreme Court Act for the appointment of Quebec members is based on the distinctive legal traditions of that province. We also reject socio-economic representational claims about Supreme Court of Canada membership, which we anticipate may emerge as the Court addresses complex Charter litigation involving citizen-state relations.

The central issue in the appointments process is the perception that it does not adequately involve the constituencies ultimately affected by Supreme Court decisions. Although the existing informal procedures followed by the Prime Minister before making appointments to the Supreme Court do involve extensive discussions, they are sometimes perceived as not taking sufficient account of concerned interests or advice. Measures to shift responsibility from the Prime Minister to some designated group or institution necessarily involve replacing one political process with another. If a broadly based political process of consultation is to be replaced by alternative arrangements, an elected Senate has much to commend it.

■ The constitutional status of the Supreme Court and, in particular, the independence of the Court, should be clarified by entrenchment, although there is no reason to remove responsibility for the administration of the Court from the federal government. □

Quebec

The Distinctive Character of Quebec Society

Quebec is characterized by the presence within its borders of a largely francophone population which controls and gives direction to its own political and social institutions. The existence of this institutional framework which reenforces the distinction between the majority status of francophones within Quebec and the position of francophones elsewhere in Canada is central to *la spécificité du Québec*. The very essence of Quebec society lies in the fact that it is the principal, though not the exclusive, focus for the political dimensions of French life in Canada. To a large extent, Quebec remains a linguistically isolated society, an island of French in an overwhelmingly anglophone sea.

For Quebec and for francophones outside the province, the central challenge will always be how to remain French in North America.

This challenge entails practical problems in the cultural and economic domains for whose resolution Quebecers and francophones outside Quebec, individually and collectively, are, themselves, ultimately responsible. But constitutional recognition of Quebec's distinctiveness and of Canada's duality would provide an affirmation that answers to the practical economic and cultural problems of French life can be pursued within the Canadian context and with the support of the rest of Canada. The necessary compromises could thus be worked out in a clearly understood context of recognition and affirmation of a cultural complementarity which is at the very heart of the Canadian experience.

■ The initial requirement at the level of principle to secure a renewed understanding between Quebec and the rest of Canada is a statement in the preamble to the Constitution along the following lines:

Recognizing the distinctive character of Quebec as the principal, though not the exclusive, centre for Canadian francophones and accepting as fundamental the duality of the Canadian federation . . .

Fundamental Guarantees

As a consequence of Quebec's uniqueness, steps should be taken to ensure that no future constitutional amendment as noted below be imposed on Quebec which that province might consider to affect its fundamental interests as a distinct society:

- **Concerning transfers of legislative powers from the provinces to Parliament, the simplest means to provide Quebec with the necessary protection, without putting the principle of equality of the provinces in question is to grant each province the right to opt out of any general arrangement with full compensation in all cases.**
- **In relation to reforms of national institutions which are not covered in the present opting-out formula, the only means to protect the interests of Quebec is through the right of veto. An obvious solution would be to grant all provinces such right in conformity with the equality principle. In the long run, this move could, however, freeze the natural development of our national institutions. Although granting Quebec the right of veto is an arrangement politically more difficult to obtain, it is closer to the intended objective, for it is the distinctive character of Quebec society for which protection is sought. It is important that Quebec have a right of veto on any amendment to the institutions described in section 42(1) of the Constitution Act, 1982, if such an amendment touches on the special character of Quebec and the duality of Canada. One method of implementing such veto would be to amend immediately section 47 of the**

Constitution Act, 1982, in order to grant French-speaking Senators the right to block proposed amendments affecting Quebec under the double-majority formula described below.

The Senate and Quebec

- With regard to federal legislation, any proposed bill with linguistic implications, before becoming law, should require a double majority of the Senate: that is, the approval of a majority of all Senators and of a majority of francophone Senators. Such veto would be a full rather than a suspensive veto. In light of the protection offered by this double-majority proposal, Commissioners see no need for specific guarantees to Quebec of a certain proportion of seats in the House of Commons.

Division of Powers

- Because of Quebec's distinctiveness, the most obvious fields where conflicts may arise between that province and the federal government are education, external relations, immigration, communications and culture. There are ways in which Quebec could participate in dealing with these areas. While we make no recommendations, we do suggest that legal mechanisms such as delegation and inter-governmental agreements may provide a better means of accommodating the specific interests of Quebec than would constitutional amendment.

Francophones Outside Quebec

- The diverse communities of Francophones in Canada outside Quebec are currently in a state of crisis. If they are to survive and flourish, prompt action is required. Commissioners suggest that beyond recognizing the principle of duality in the Preamble, governments should make efforts to extend the recognition of French and English as the official languages of individual provinces. Ontario in particular, with its large French-speaking population, should proceed promptly to implement official bilingualism. Such a step would set an example for other provinces.

- Scattered French-language communities outside of Quebec face difficulties in developing a French-language working environment. Efforts to solve this problem should be geared towards the development of French-language centres of activity. These centres would vary from province to province, depending on the population and geographic concentration of francophone Canadians. In some areas, the centres would be of an essentially cultural or educational nature, and in other areas, such as in

New Brunswick, they could include a strong economic component.

- Furthermore, this Commission wishes to point out that implementation of language rights has not kept up with the intended policy of bilingualism. We believe that litigation, while generally useful, is not the proper tool for making improvements in this direction, since it is a lengthy and costly method of dealing with these problems.
- Instead, we recommend that stronger support be given to the role of the Commissioner of Official Languages. ☐

Aboriginal Self-Government

Measures to increase the influence and control exercised by aboriginal people over their social and economic affairs are desirable. Our commitment to this objective is based on the distinctive place of aboriginals in Canadian society as the first peoples of Canada and on the constitutional recognition they now enjoy.

Institutional reforms to enhance the autonomy of aboriginal peoples focus on the idea of self-government. Implications of aboriginal self-government for Canada's overall institutional framework and, in particular, for the three pillars of the Canadian constitutional order, Parliament, federalism and the Charter, have not yet been clarified. Indeed, many important issues have been avoided and should be addressed more squarely. The fundamental changes to our national and provincial institutions that are now being contemplated need broad Canadian understanding if they are to be acceptable in the long run. The pace of discussions, as well as the comprehensiveness of debates in Parliament and the legislatures should reflect this concern.

The Northern Territories

The economic, social and environmental challenges of development in Northern Canada will remain of continuing concern to Canadians. From an institutional perspective, significant questions must be addressed – some of these in the near future.

- No Canadians – Natives and non-Natives, Northerners and Southerners – can be well served by further delays in the settlement of aboriginal land claims. Final agreements affirming and delimiting aboriginal rights should be actively encouraged. If necessary, deadlines should be established by the parties, and discussions could proceed without reference to the issues of legislative powers, sovereignty and special political status, which could be dealt with subsequently in other settings.
- The Yukon Act and the Northwest Territories Act should be amended to reflect the current practices of responsible government in Yukon and to encourage comparable evolution in the Northwest Territories. In both territories, new formula-

based financial arrangements should be negotiated, to increase the predictability of transfers and to promote genuine responsibility and accountability for expenditures.

- On the basis of federal commitment to the ultimate goal of some form of provincehood in the Northern territories, the governments involved should establish a timetable for the transfer of provincial-type responsibilities in areas such as health, labour relations, inland waters, renewable resources and the institution of criminal proceedings. Additional measures should be taken to:
  - Advance the process of transferring to territorial governments responsibilities for Crown lands that do not bear directly on the national interest and that have not been ceded to the Native people through claims settlements
  - Institute resource-revenue/sharing arrangements comparable to the types of agreements worked out with Nova Scotia and Newfoundland
  - Confirm participation of the territorial governments in federal-provincial forums where matters of direct concern to Northern residents are being discussed. Joint-management arrangements may be valuable transitional procedures.
- Failing an internally generated and ratified agreement on division of the Northwest Territories, the federal government should establish an independent boundary commission to recommend a boundary on the basis of arguments from the two constitutional forums. Subject to the spirit of the Canadian constitutional tradition and the need to recognize the essential quality of Canadian citizenship, the structure of post-division government should be left to the discretion of the respective constitutional forums. □

Municipalities

Local governments are an enduring and important feature of government in Canada, despite their lack of constitutional status. Variations in approaches to local government in different provinces have permitted sensitivity, dynamism and creativity in the city-province relationship. Existing arrangements have contributed to the development of some of the most liveable cities in the world. Local governments have experienced uncertainty and frustration because of limited policy-making instruments and their relations with provincial and federal governments, but responses to current concerns must begin from the premise that we have been doing something right. Canada's major cities should be provided with the legal, financial and institutional means to fulfill their economic development role. By and large, this involves removing constraints that prevent their involvement in development.

■ Although Commissioners do not recommend changing the constitutional status of local governments, the federal and provincial governments should increase the involvement and responsibility of local authorities. The federal government should review with the provinces the possibility of occasional tri-level conferences; improve communications between municipalities and ministers whose responsibilities affect local interests; assign responsibility to investigate the significance of local concerns in national policy to the proposed Standing Committee for Intergovernmental Relations; and explore opportunities for the decentralization of specific responsibilities, including airports and federal urban properties to federally-appointed local agencies. The use of the delegation amendment, as Commissioners have earlier proposed, may become a means to delegate directly to local governments responsibility for such questions as siting, development and administration of some airports through agreement with the relevant province.

The provincial governments should continue to assess possibilities for assuming financial responsibility for requirements greatly exceeding local revenue sources. Commissioners also recommend that the provinces examine ways to designate a specific portion of income or sales-tax revenues for local government financing. Commissioners believe that revenues to local governments should be increasingly unconditional. □

SUPPLEMENTARY STATEMENTS

Clarence L. Barber

The Commission's Final Report is a long and complex document and I support many of its recommendations. However, in certain areas I do not agree with the tone and thrust of the Report and I outline here my differences in viewpoint and conclusions.

My major concerns arise in connection with the Report's treatment of unemployment and inflation, monetary, fiscal and exchange rate policy and related topics. This is an area economists call macro-economics. The views expressed in the Report in this area may well reflect the views expressed in the Commission's research program. However, the profession is deeply divided on many of these topics and my own views differ substantially from those expressed in the Report.

1. There can be no doubt that the developed world today is suffering severely from the legacy of the extremely tight monetary policies pursued over the period from 1980 to 1982. These policies were based on a belief that the first step towards achieving good economic performance is to bring and keep inflation under control. What the world's central bankers may have failed to understand is that in breaking inflationary expectations they may also have destroyed the world's *real growth expectations*. It may be that far from setting the stage for good economic performance, they have ushered in an era of slow growth and semi-stagnation.

   In capitalist enterprise economies, real growth is largely dependent on the strength of private investment spending. Because capital equipment is typically long-lasting, business firms will only carry out these expenditures when they are confident that a growing economy will bring about their utilization. Thus, it is anticipated real growth that is one of the keys to a prosperous high-employment economy. As Keynes so strongly emphasized, the volume of capital spending required to sustain high employment growth is related to the savings level. In countries where the savings rate is high, such as in West Germany and Japan, a high rate of investment is required if this savings is to be realized in new capital equipment. In its absence, a high rate of savings simply results in a depressed economy and high government deficits, such as we have in Canada today. One of the primary causes of the high level of unemployment that exists in much of the developed world today may well be an excessive level of saving, that is, saving in excess of the amount private business firms are willing to invest. By the same token, the relative prosperity of the U.S. economy may reflect the comparatively low-saving level of the American people.

Private capital spending is weak in many countries today and this undoubtedly reflects uncertainty about future growth. As long as the world economy was growing steadily, as it was throughout the period 1948 to 1973, capital spending was strong. Since then, with much slower growth and more restrictive government policies, capital spending has been weak. In a sense the world economy has lost its growth momentum. It may not be easily restored.

2. The Report stresses the view that there is no long run trade-off between unemployment and inflation. If we attempt to reduce unemployment below a range of 6.5 to 8.0 per cent, it is argued, inflation will gradually accelerate. When unemployment rises above this level, the inflation rate will decline. I find it hard to reconcile this view with the exceptionally low unemployment levels achieved by many countries over the period from 1948 to 1973 with relatively moderate, if gradually increasing, inflation. For example, over this period unemployment rates averaged 1.5 per cent in the Netherlands, 1.6 per cent in Australia and 2.0 per cent in France and West Germany. I doubt that the "no trade-off" conclusion can be held with any certainty.

   During the Commission's hearings, at least two economists argued that government policy should give priority to employment over inflation. We should aim, they argued, to reduce unemployment to some relatively low level, say 5 per cent, and if inflation developed along the way, deal with it directly. I think there is considerable merit in this point of view. I don't think we know with any certainty at what unemployment level inflation may become a problem, particularly in the context of stable commodity and energy prices, such as we experienced in the fifties and sixties.

3. The Commission's Report takes the view that some form of incomes policy may be useful on a temporary basis, but argues against any role for incomes policy on a longer-term basis. I disagree. I believe that it would be possible to work out on a co-operative basis between representatives of labour, business and government, a form of incomes policy which could contribute substantially to moderating the inflationary impact of future commodity price shocks.

4. I do not agree with the view that says we should take almost immediate steps to deal with our structural deficit problem. The federal deficit is primarily the result of a major private sector failure, the failure of the private sector to spend on new capital goods as much as it is saving. The

deficit, in turn, has represented a kind of *massive bail-out* to private sector savers, many of them in the higher income brackets. In the absence of the federal government's willingness to incur a deficit, these excess savings would have caused incomes to fall and unemployment to increase, perhaps to unprecedented levels. Canada would soon grow out of its deficit problem if we could stimulate a revival in capital spending and a reduction in saving rates. When we get back to 6 or 7 per cent unemployment, it may be time to adopt tax measures to reduce the deficit. The sooner we get there, the smaller our national debt will be at that time.

5. I view the suggestion that Canada should consider shifting from an income tax system to an expenditure tax system with a great deal of scepticism. If its effect would be to increase Canada's already high savings rate, the result might well be a disaster. I also have grave doubts about its effects on our income distribution.
6. If Canada should negotiate a free trade area agreement with the United States, one of the keys to a successful outcome will be a well-managed exchange rate. Canada's exchange rate policy should be oriented to the country's need for foreign investment as reflected by the difference between private sector capital spending and saving at a high level of employment. When capital spending exceeds saving at high employment levels, the difference can be made up either by means of a government surplus or through a current account deficit. When savings exceed capital spending, a current account surplus may be appropriate. The exchange rate is an appropriate method of adjusting our current account position. To achieve this will require the proper mix of monetary and fiscal policy.

   The Bank of Canada could be of substantial assistance to private operators in the exchange market if it published on a regular basis a purchasing power parity value for the Canadian dollar, both as against the U.S. dollar and on a trade weighted basis. The appropriate price for use in such a measure is the implicit price of GNP.
7. Our experience in the early eighties has shown the enormous power that can be exercised by central bankers. In view of this, I believe that some steps should be taken to make the Governor of the Bank of Canada more accountable for his actions.
8. Finally, I must record the view that the Commission's macro-economics research program failed to deal with a number of important economic issues. Thus, there was no serious examination of why the sustained prosperity of the sixties suddenly gave way to stagflation in the early seventies. Nor was there an examination of the basis of the commodity price explosion between 1972 and 1974. Again, the whole question of capital investment which is so essential to the functioning of our economy, received very little attention, even though there has been very little growth in volume of capital spending in the developed world since 1973. Perhaps most important of all, demographers are now predicting that Canada may have a stationary or declining population within 35 years. We know little about how well a private-enterprise economy would perform in such a context. The subject is in need of serious examination as the Commission's Report recommends.

Albert Breton

I. Introduction

I hold with considerable conviction to the notion that the mechanisms which discipline and constrain democratic politics, especially democratic politics in federal states, operate with as much force as those which discipline and constrain economic life. That is not a widely shared view, though it is one that is gaining ground. The traditional and more conventional view is that economic mechanisms are so constraining as to be essentially deterministic, while politics, being the exercise of power, can be set in motion or stopped, as it were, at will. In that view, politics is always capricious and beyond rational explanation.

To my knowledge, Commissioners never held to the traditional view of politics, but it is fair to say, I believe, that neither did most of us accept the notion that political mechanisms are as constraining as economic ones. Over the last two and a half years, our views of politics, and especially of democratic politics in federal systems, have moved quite far away from the traditional concept, as readers of the Commission's Report will have been able to witness for themselves. However, in my opinion, the movement has not been sufficiently great. In a way, that is understandable because breaking away from traditional modes of thought, even in the face of dire necessity, is never easy.

The discussion that follows, submitted as a supplementary view to the Commission's Report, is therefore a clarification and an extension of the theory of democratic politics in federal states, a theory which I call the theory of competitive federalism. To put it differently, in what follows, I provide a brief but more extensive analysis of the mechanisms of competitive federalism, indicate some reforms that are necessary if we wish these mechanisms to be more efficient, and draw a few implications of the theory for certain key issues. I insist that there is still much research to be done in this area and many problems to be resolved. However, I believe that what can be defended seriously at this moment should be present in the debates which the Commission's Report will no doubt engender. Hence this document.

The following discussion is divided into four sections. After this Introduction, Section II examines the nature and properties of competitive politics in a federal state. In Section III, I derive implications of that analysis for a number of questions such as those of the economic union, intergovernmental grants, and municipal governments. Section IV concludes my statement.

II. Theory

It has been and, to a large extent, remains conventional wisdom that the two pillars which define Canada's political institutions – parliamentary government and federalism – lack congruence.[1] That view springs from an *a priori* abstract and formal definition of what constitutes parliamentarism to which is added a no less abstract and formal notion of federalism. The presumed lack of congruence has had enormous influence, not only on the way Canadians think about politics, but also on the way they have conditioned the evolution of their political institutions. It is true that for almost a century and a quarter Canadian parliamentarism and federalism have co-existed in more or less harmonious fashion, but the general tendency – still present in the Commission's Report – to set parliamentary institutions and federalism in opposition or, if not, to view them as separate and unrelated to one another, is at the root of many of our difficulties.

From the beginning of their history as a country to the present, Canadians have reflected on their political institutions with one eye on the United Kingdom and the other on the United States. England was and remains a unitary-parliamentary system, while the U.S. was and is a federal-congressional structure. Hence the following questions: Could a federal-parliamentary system work? Should priority be given to parliamentarism or to federalism? With which one of these two pillars is democracy more closely associated?

I wish to argue that parliamentarism and federalism are congruent; that the issue of having to give priority to either in opting for democracy is a false one; and that it is possible to reform our national and federal institutions in ways that increase their effectiveness, while remaining true to their fundamental genius. A clarification of these issues is necessarily an intellectual exercise, one which requires the selection of a particular language. Being an economist by training and by preference, I feel more at ease formulating and discussing issues, even those outside the traditional frontiers of economics (problems of politics and of society, the traditional domains of political science and of the other social sciences), in the language of that discipline. At the same time, such a strategy makes it easier to draw on the powerful methodology of economics. There is, finally, a third bonus that comes from stating the issues of politics in the language of economics: it makes it easier to go from political to economic real life questions and issues and it makes it easier to formulate a theory of politics that is "compatible" with economic theory. I know from having worked with sociologists and political scientists over many years that the translation from one language to another is a relatively easy matter and that nothing substantive is altered in the process.

Parliamentary (that is, responsible or party) government was not designed. It evolved in response to pressures and influences applied first to monarchs by powerful interests and then, throughout history, to those in office by new emerging centres of power. The dynamics of parliamentarism are appropriately, if somewhat summarily, encapsulated by the expression "elite accommodation".

There is not much competition (or not many "checks and balances": the kinds of behaviours associated with political competition within governments, as distinguished from competition between governments) in such a system. There are, of course, the checks and balances that come from powerful interests, whether economic (like business and labour, though these are not usually of equal strength), religious (churches), intellectual (academics and research organizations), and so on. There are also the checks and balances that come from the Question Period in the House of Commons, from the log-rolling that takes place in caucus and from public opinion. Finally, and very importantly, there is the competition that originates in the requirement of popular support elicited in contested elections at more or less regular intervals.

All in all, however, competition is quite weak, especially when Cabinet is supported by a good parliamentary majority. The weakness of the checks and balances that come from the lack of separation between the executive and legislative branches is aggravated by the "independence" of the judiciary, an independence which is reflected in the doctrine of "parliamentary supremacy", as contrasted to the doctrine of "judicial review". (I return to this question below (Section III.4), when I discuss the place of the Charter of Rights and Freedoms in Canadian politics.)

A necessary implication of the foregoing is that the preferences, aspirations and opinions of the public, unless they are adopted by the power elites, are not likely to be represented as vividly as they would be in a system in which competition was more vibrant. This overly schematic description of parliamentarism would be even more incomplete if I did not immediately add that the system is susceptible to improvements. The system is capable, as history documents, of absorbing further checks and balances, while at the same time remaining faithful to its own virtues and genius.

The Report contains recommendations which go in the direction of improving competition, such as those aimed at removing budget secrecy and at reforming the Senate, recommendations that I support, although I will have more to say on Senate reform below. But one could go further. I would suggest that in addition *serious consideration should be given to finding ways of reducing party discipline in the House of Commons and, to the extent that it exists, in Parliamentary Committees as well, for all matters, except budgetary ones.* If that was done – slowly, but deliberately – the power of elected representatives would be increased, their ability to voice the opinions of their constituents would be enhanced, and the capacity of constituents to influence governments would be augmented.

Responsible or party government in unitary states, however fine-tuned to better reflect the preferences of citizens, remains a weak mechanism in the performance of the task I have just noted. But when responsible government is married to federalism, that job is done much more effectively. I must hasten to add that some marriages are more successful than others and that some federal structures are better designed than others. I will explore these issues in the pages that follow and indicate what I believe are the ingredients of a good federalism and of a good marriage of federalism with party government. However, the central proposition holds: parliamentary government combined with federalism give the citizens of a country a more effective set of institutions for reflecting their will, preferences and aspirations. Responsible government is democratic government; but responsible government plus federalism is extended democracy, simply because there is more competition.

I must, therefore, address two preliminary questions: How does federalism introduce more competition in any system of government, more particularly, in a system of responsible government? Is competition a "good" thing, that is, something we should want in our political institutions? I will seek to answer these two questions in Sections II.2 and II.4 below. As an introduction to that discussion – and in recognition of the fact that competition is so central to my view of politics and of democracy – I must devote some space to clarification of the meaning I give to the word competition.

1. Competition

The development of mainline economic thought in the Anglo-American tradition – by any measure the overwhelming tradition – has systematically restricted the notion of competition to price competition. This tradition has come to focus on the conditions under which this kind of competition leads to (Pareto) efficiency, that is, to that state in which no one individual can be made better off without someone else being made worse off. Significantly, this neo-classical tradition has not associated any particular behaviours or activities with its definition of competition.

Since the conditions under which competition is optimal in one sense or another will be examined later on for the case of competitive federalism, it may be worth noting that it is only in the case of price competition that the conditions are known under which competition is Pareto optimal. In other words, under certain conditions, Adam Smith's "invisible hand" allocates resources efficiently for the case of price competition. Although there has been much discussion in the literature on advertising and quality competition, and less, though still a respectable amount, on competition involving research and development expenditures, innovation and technology, it is not known if these various forms of competition are socially efficient. Until recently, the weight of opinion in the profession would have been, I believe, that they were not. Things have been changing in recent years, but no consensus, not even a minimal one, has emerged.

I mention this to underscore that even if it is not possible to specify all the conditions – those that are necessary as well as those that are sufficient – under which political competition in a federal state is optimal, that does not constitute a basis for rejecting such competition, any more than our inability to specify necessary and sufficient conditions for economic competition to be efficient is a satisfactory ground for rejecting market organization.

Price competition must be contrasted to other kinds of competition, which have from time to time retained the attention of economists and others. There are a number of strands in the literature associated with such labels as "working competition" and "countervailing power". One of the more important of these is the notion of *entrepreneurial competition*, sometimes also called Austrian or Schumpeterian competition. In the early 1900's an important number of (to become distinguished) Austrian economists (notably Joseph Schumpeter, Ludwig Mises and Frederick Hayek), seeking to come to grips with the crucial Marxian question of the dynamics of capitalism, proposed theories of economic development in which that particular notion of competition played a central role.

In the words of Schumpeter, one of the ablest analysts of this kind of competition:

> *In capitalist reality as distinguished from its textbook picture, it is not that kind of competition (price competition) which counts but the competition from the new commodity, the new technology, the new source of supply, the new type of organization . . . competition which commands a decisive cost or quality advantage and which strikes not at the margins of the profits and the outputs of the existing firms but at their foundations and their very lives. This kind of competition is as much more effective than the other as a bombardment is in comparison with forcing a door, so much more important that it becomes a matter of comparative indifference whether competition in the ordinary sense functions more or less promptly; the powerful lever that in the long run expands output and brings down prices is in any case made of other stuff.*[2]

Notwithstanding the fact that barriers are sometimes erected to soften the impact of entrepreneurial competition, one must acknowledge that in seeking to understand the economic factors that determine how resources are allocated, as well as the forces that have shaped the broad development of capitalism, the Austrians' notion of competition is more useful than that of mainline neo-classical theory.[3]

It is not an accident that the extension of the analytical tools of economics to politics was initiated by Schumpeter (although Niccolo Machiavelli and John Stuart Mill, among others, had anticipated the possibility): it was a natural outgrowth of his work on entrepreneurial competition. Politicians, in that view, are entrepreneurs who compete for resources by introducing new politics, by developing new forms of organization, by heralding new unifying symbols, by structuring a new social consensus, etcetera. Recent writers have characterized entrepreneurial competition as "alertness to opportunities".[4] If that is a good definition of entrepreneurship, it cannot be limited to the realm of economics, but extends naturally to politics and to other areas of life. To be sure, the "*modus operandi* of competition" (to use a Schumpeterian expression) will vary between business and political entrepreneurs, but their behaviour will have enough in common to be called competitive.

Having said that, it must be recognized that not much is known about competitive processes. Earlier, in referring to intra-governmental competition – the competition between political parties, between the executive, legislative and judicial branches of government (when such competition exists), between the various departments and bureaus that constitute the bureaucracy of a particular governmental unit, such as that of Quebec or Saskatchewan – I used the American expression "checks and balances". These words correspond to more or less specific and precise behaviour and are useful in characterizing that kind of competition. In his study of *American Capitalism*,[5] Galbraith used the evocative term "countervailing power" in an effort to describe a particular process of competition. Recently, Nelson and Winter[6] have sought to model entrepreneurial competition in terms of two activities: "do research" or "do imitation". A friend of mine, having read an earlier draft of this statement, suggested that the behaviour associated with federal-provincial competition was "complement and countervail". To illustrate, if the federal government chose to subsidize post-secondary education by giving money directly to students instead of giving it to provincial governments, these latter could "complement" by targeting their spending on education more closely to their own priorities, or "countervail" by taking the money away from students.

This area of study is in its infancy. I cannot therefore associate particular competitive processes with the various kinds of entrepreneurial competition that I will discuss below. Because it is appropriate, I use the words "checks and balances" for intra-governmental competition; otherwise, for politics as for economics, I use the word competition, having in mind entrepreneurial competition, but no particular behavioural process.

2. Federalism

At its simplest, that is, before introducing real world complications into the picture – a task to be undertaken later – a federal state can be formally defined as a type of political organization in which there are at least two levels of jurisdiction – in Canada, national and provincial – between which the entire set of constitutional powers is divided. The assignment of these powers between the governmental levels is not made by one level alone. That distinguishes federalism from confederalism, a system in which the assignment of powers is made by the provinces alone, and from unitary states, structures in which powers are assigned by senior governments acting in isolation. According to that definition, Canada is and has been a federation and never a confederation. The Canadian provinces, on the other hand, in their relationship with their municipalities, are unitary states.

The division of powers and the mode through which it is effected define federalism well, albeit in a way that is too formal to be very useful in understanding how such a system actually works. From that point of view, what is much more important are the implications of any division of powers for the operations of, and relationships between, the governments of the federation, all of which are responsible governments. The central and most important implication is that in the search for popular support – something that is as needed for the effectiveness of governing parties as revenue is essential for the effectiveness of business firms – the governments of a federation will find themselves competing with each other. Federalism thus adds more competition to that already present in responsible or party government.

One point needs emphasis. Political competition is not something that politicians choose or want, whatever their commitment to federalism and, more broadly, to liberty and to democracy. In that respect, they are exactly like business entrepreneurs who do not want competition either. Competition arises from the necessity to respond to the actions of others; it is "forced" on people by the environment. One does not even have to be aware that one is competing to be competitive. A business firm that adopts a new technology to reduce its costs is acting competitively; one that advertises and places some of its output on sale is acting in a competitive fashion; someone who supports a particular social movement or a particular lobby is competing; as is the politician who seeks harmony with provincial governments by removing the contentious questions from the agenda of federal-provincial encounters.

There is so much mystification about this that I must dwell on two corollary points, at the risk of seeming to insist on the obvious for those who have seen their way clear on the subject. First, there is the whole bag of issues that are best summarized by the words "co-operative federalism". What is co-operative federalism and how is it to be distinguished from other types of federalisms? To my knowledge, the expression has never been formally defined. That may not be a lacuna because we all have, from practical experience and observation, a good intuitive idea of what is meant by these two words. Two or more persons working together to lift a heavy object; two or more persons engaged in a search for something lost; two or more persons removing snow from a road; these are examples of the kind of behaviour we have in mind when we think of co-operation. In other words, someone helping someone else achieve a certain goal or objective.

Co-operative federalism by analogy would exist if all the politicians of a federation worked together to achieve some collective end. Instead of working on their own for their citizens, governments would work together for the betterment of all "the people". Before examining what is meant by co-operative federalism in more detail, I would like the reader to ask him or herself why it is that we do not, as societies, organize the search for justice on a co-operative basis, but instead set defence against prosecuting attorneys in courts of law? Why do we not organize the working of party politics on a co-operative basis, but instead pit political parties against each other in grand electoral contests? Why do we not organize the search for truth on a co-operative basis, but instead require scholars and scientists to compete for research funds and for limited space in research publications? And, finally – though the list could go on – why do we not organize the production of goods and services on a co-operative basis, but instead implement laws that make co-operation an offence?

These examples underline the fact that in some areas, co-operation is *not* an efficient principle of social organization and that it is less efficient than competition, essentially because co-operation can easily degenerate into collusion, conspiracy and connivance and that this is not necessarily good! In the case of federalism, would co-operation be a better principle of social organization than competition? I will only begin to answer this question here; the answer will be completed in Section II.5. To answer the question, it must be recognized that co-operative federalism is aimed at removing the competition which is a natural by-product of federal organization. Consequently, to be able to answer the question, it is necessary to know whether competition is a "good" feature of political organizations. I do not address this issue before Section II.4.

I have posed the question here, however, because I wish to stress that the notion of co-operative federalism is part and parcel of the politics of "élite accommodation" which plays such an important role in the dynamics of party governments. Indeed, in practice, co-operative federalism is nothing but executive federalism. This has been defined by Smiley "as the relations between elected and appointed officials of the two orders of government in federal-provincial interactions and among the executives of the provinces in interprovincial interactions".[7] I will argue later that there is a place for a limited executive federalism. The executive federalism contemplated by co-operative federalists, however, effectively extends to all the areas of federal-provincial contact. It transfers to executive and bureaucratic bargaining and negotiation what properly belongs to the realm of the political.

Co-operative federalism does not necessarily eliminate federalist competition, but by moving it into executive and bureaucratic offices and corridors, it mutes its public manifestations and its effectiveness. The heart of co-operative federalism is secret deals, not the stuff on which a lively democracy thrives! There are other implications of the doctrine of co-operative federalism; I mention two.

A first is a by-product of drumming into the psyche of Canadians the belief that federalism is or should be co-operative. Once that is achieved, it provides a fruitful background for the arguments of those, sometimes in one province, sometimes in another, who wish to promote and foster separatism. Indeed, a process that is inherently competitive, even if it is called co-operative, is bound to throw up incidents which separatists – themselves competitive individuals – will use to argue that "the system does not work", because on a particular matter the politicians of a province have been rebuffed or have simply lost in the competitive game. It would be relatively easy to document that the rhetoric of Canadian separatists is often based on the notion that federalism is not as co-operative as one had been led to believe it should be. I cannot undertake that documentation task here. I simply note that if Canadians had been helped to understand that federalist politics, like all politics, is inherently competitive, the propaganda of separatism would have fallen on more barren ground.

A second implication of the doctrine of co-operative federalism relates to the condemnation, by those who adhere to it, of unilateralism, that is, of independent action by any one government of the federation. Unilateral action by one government is, of course, a derogation from co-operation, since when one is acting alone one is not co-operating. Consequently, those who espouse co-operative federalism decry unilateral action on the part of any government in the federation. Although in principle, the condemnation applies to all, in practice it strikes much harder at the federal government, simply because the provinces, if they want to act in unison, have to come to an agreement – something that is not easy to do for essentially competitive entities. To put it differently, in the normal course of affairs, the central government is likely to act unilaterally more often than the provinces, to the extent that these wish to act as one, because the costs of co-ordination are positive. A condemnation of unilateralism, if enforced, would therefore affect the central government more than the provinces.

Co-operative federalism, because it proscribes unilateral action, is therefore a disguised ploy to shackle the federal government, to prevent it from addressing the problems it alone can resolve and is constitutionally responsible for resolving. Indeed, condemning federal unilateralism is condemning the federal government for acting constitutionally! This is so true that if one takes the trouble to go behind the language of co-operative federalism, to the reality of the arguments which it seeks to convey, one discovers either confederalism or a conservative view which seeks to reduce the role of the federal government and, indeed, of all governments in society.

In concluding this argument, I note that the condemnation of unilateralism is also a denial that the division of powers between orders of government is essential to federalism. That indeed is the crux of the matter. Co-operative federalism, if it came to pass, would deny federalism itself. Those who seek co-operative federalism and labour for its realization, seek and labour for a unitary state, disguised in the trappings of federalism, but from which competition would have been reduced to a minimum or even eliminated.

The second corollary point related to the mystification surrounding the notion of political competition pertains to the language of competition and of federalism. Competition in the marketplace, in courtrooms, in parliaments, on hustings, in university seminars, and wherever it takes place is sometimes smooth, so smooth that one could be led into believing that it is not there. But at other times, it is rough, so rough that outsiders are often at a loss in trying to understand why so much energy and effort are displayed, why opponents are characterized in such vile fashion, why the parties become uncouth and impolite in the process of competing. In describing this second circumstance, it is not uncommon for the outsiders, who would have no problem with "well-behaved" competition, to describe the situation in terms of conflict, rancour, combat, suspicion, disharmony, and so on, and to attach to these expressions a negative connotation. The stage is then set for appeals to co-operation and for a rhetoric that praises the virtues of co-operative federalism.

Words have emotional content. For that reason, debates and disagreements are sometimes resolved by using a different language. It is important, however, that the change in vocabulary be only that, not the occasion for unnecessary changes in institutions. When competition is acrimonious one may wish to reduce its acrimoniousness; that can be a legitimate objective. But it is not because we choose to relabel a competitive process by some other name, such as conflict, disharmony, or rivalry, that we will have improved things. Indeed, if relabelling leads to the search for unwarranted institutional changes, we may have worsened the situation. Prosecuting and defence attorneys may be uncouth and antagonistic to each other; things could possibly be better if such behaviour did not exist, but surely justice would not be well served, if, to remove such behaviour, courtroom procedures were transformed from competitive into co-operative ones!

Many a time I have been struck by the fact that those who resist the notion of competition and its reality in fact take offence at the language of competition. The question of how a language can be made more genteel and gracious is an interesting and difficult one. It may be possible to have a genteel and graceful competitive federalism, but whether it is or not has little bearing on whether competitive federalism is desirable or not.

Before moving on to a discussion of the costs and benefits of political competition and to an overall evaluation of its worth, I must deal with two subjects that are likely to be of most interest to specialists of co-operative federalism, but which must be cleared up if what I call competitive federalism is to be understood. For that reason, I encourage even those who are not co-operative federalists to stay with me through the next section.

3. Not Co-operation and Not Anarchy

The "proof" that co-operation in federations is beneficial has traditionally been based on sentimentalism and romanticism. Many people do not mind this, but scholars have generally sought to extract themselves from such clutches; consequently they have searched for a rigorous theory of federalism that would provide them with the desired proof. One of the theories used by these scholars derives from an application to federalism of the theory of games, specifically an application of the theory of the non-co-operative game known as "prisoner's dilemma".[8]

That theory is a representation of a situation in which non-co-operative behaviour on the part of individuals leads to an outcome that is inefficient, in that if the individuals could enter into a pre-game binding agreement to co-operate, they would choose another outcome than the one that obtains in the absence of co-operation. In the words of Luce and Raiffa, the prisoner's dilemma game can be characterized as follows:

> *Two suspects are taken into custody* and separated. *This district attorney is certain that they are guilty of a specific crime, but he does not have adequate evidence to convict them at a trial. He points out to each prisoner that each has two alternatives: to confess to the crime the police are sure they have done, or not to confess. If they both do not confess, then the district attorney states he will book them on some very minor trumped-up charge such as petty larceny and illegal possession of a weapon, and they will both receive minor punishment; if they both confess they will be prosecuted, but he will recommend less than the most severe sentence; but if one confesses and the other does not, then the confessor will receive lenient treatment for turning state's evidence whereas the latter will get "the book" slapped at him.*[9]

If they could co-operate, the two suspects would decide not to confess. But being separated and held incommunicado, they will both confess, each to "receive lenient treatment", but both will get "the book". This serves to show that non-co-operative behaviour is inefficient.

The question is whether the prisoner's dilemma game is an appropriate model to think about and to analyse federalism. In other words, will the co-operative behaviour which would lead to efficient results in the prisoner's dilemma game also lead to efficient results in the case of federalism? The answer must be a resounding no. The prisoner's dilemma game is simply not an appropriate model for federalism. Why? For two reasons.

The first and the most obvious is that the governments of federal states are not kept incommunicado. In Canada, with close to one thousand federal-provincial meetings per year, it is hard to assume that the parties are separated.

The second reason for the inapplicability of the prisoner's dilemma model to federalism is more basic. As the Luce and Raiffa narration makes clear, there are no gains from competition in a prisoner's dilemma model: there are only gains from co-operation. To understand the full burden of this point, assume that the parties in the game are not criminal suspects, but ordinary oligopolists. Would we also conclude that they should co-operate (collude?) to improve their position? The logic of the prisoner's dilemma model would seem to push us in that direction. In this "oligopolist's dilemma" game, it is our instinct as economists – for those of us who are – which keeps us in check; we know that the logic of co-operation appears correct only because consumers are left out of the game. Once their presence is acknowledged, it is easy to understand that competition is for their benefit. We must conclude that co-operation benefits the oligopolists, while competition serves consumers. That is why the prisoner's dilemma model cannot be used to analyse oligopolies.

It is essentially for the same reason that the prisoner's dilemma game cannot be used to analyse federalism. In this case, citizens are left out of the picture. They are the ones who benefit from competition. If that is the case, how are thoughtful scholars led to adopt a completely inappropriate model to analyse federalism? The answer must be that underlying the use of the prisoner's dilemma model is the (tacit) assumption that provincial governments perfectly embody the interests of the people of their respective provinces. There is no role for competition because each provincial government is assumed to be serving its people perfectly! All models of co-operative federalism in fact make the same assumption.

We are therefore back to competition and to competitive federalism. But competitive behaviour is not unconstrained or anarchical behaviour; indeed competition would not survive, still less be efficient, if such behaviour was the rule. In fact competitive behaviour is restrained and disciplined behaviour.

One thing that can discipline competition is legally enforced property rights. One of the best definitions of these is that provided by Dales. I quote:

> *In everyday conversation we usually speak of "property" rather than "property rights", but the contraction is misleading if it tends to make us think of property as things rather than as* rights, *or of ownership as outright rather than circumscribed . . . When you own a car, you own a set of legally defined rights to use the vehicle in certain ways and not in others; you may not use it as a personal weapon, for example, nor may you leave it unattended beside a fire hydrant. Among the most important rights you do have are the right to prevent others from using the vehicle, except with your permission and on your terms, and the right to divest yourself of your ownership rights in the vehicle by selling them to someone else. We may say, then, that ownership always consists of (1) a set of rights to use property in certain ways (and a set of negative rights or prohibitions, that prevent its use in other ways); (2) a right to prevent others from exercising those rights, or to set the terms on which others may exercise them; and (3) a right to sell your property rights.*[10]

Property rights extend beyond physical objects like cars, to things such as bonds, shares of stock and money. They extend to one's time (which can be sold as labour or consumed as leisure); it is important that they extend to roads, canals, air waves, and, as the Law of the Sea Conference made abundantly clear, especially during the last four or five years of negotiations, to the oceans and the seabeds.

It is important to stress that property rights may or may not be related to private property. Indeed, property rights can be vested in individuals, in groups (such as corporations) and in governments or other public bodies. That is, property rights can be private or collective. On August 8, 1983, *The Globe and Mail* reported on a debate in the Department of External Affairs in Ottawa on whether the Antarctic should be considered the "common heritage of mankind" or be assigned to "a select group of nations that already have scientific and commercial interests in Antarctica" (p. 9); that is a debate about property rights.

But sometimes legally-enforced property rights do not exist. That may result from failures in legislation or in law enforcement, but it may also derive from intrinsic problems as in the case of public goods, intellectual property, common property, and so on. In such instances, substitutes have to be found if they do not "spontaneously" arise; otherwise competition will be inefficient. I cannot here analyse all the – sometimes nearly perfect, sometimes much less than perfect – substitutes for legally-enforced property rights. I suggest two which I believe have a special role in disciplining competition in federal states. The first is trust, which, even if it is important, cannot be legislated and is less susceptible to improvement through institutional reform. I will, consequently, just mention it. The second is "monitoring",[11] which I introduce here, but will discuss at length below, in Sections II.8 and II.9.

Trust can be a substitute for property rights. It need not, obviously, be a perfect substitute for them, in the sense that both trust and legally-enforced property rights can co-exist. Trust is a substitute for property rights if the competing parties are confident (i.e. trust, believe) that each will abide by the rules of the game. The parties compete, but there are certain behaviours and activities which are proscribed – possibly only through tacit understanding – and to which neither party will resort.

Another substitute for property rights (and for trust) is "monitoring". The function of property rights is to define penalty-reward structures which, if they are efficient, ensure that one party does not, through his or her actions, impose costs on others that are out of proportion to the benefits he or she derives for these actions. A "monitor" can obviously do this. A "monitor" can be a person, but it can also be an institution. I distinguish below between horizontal and vertical competition. The first refers to interprovincial competition, while the second relates to federal-provincial competition. I will argue that the federal government and a number of "self-regulating" federal institutions are natural "monitors" of horizontal competition. I will also argue that the natural "monitor" of vertical competition is a reformed Senate. Before I can do justice to that problem, there are a number of issues that must be cleared up.

One point needs to be emphasized immediately, however. Property rights are never perfect, trust is never absolute, and "monitors" as well as "monitoring" devices are all of human fabrication. Because of this, competition is never absolutely efficient. It will sometimes attain its maximum efficiency, which may be far from the ideal; at other times it will even attain less than that maximum. That is true in politics, as it is in economics.

There is no doubt that at times competition in the Canadian federation has been less than efficient, possibly even destructive. The problems of economic union, which are at the centre of the Royal Commission's mandate, raise this question with urgency. Are certain policies adopted by governments in the pursuit of local objectives, but which impede the free flow of resources, inefficient competitive policies? I address this and other like questions below.

It is important, however, when faced with a situation of inefficient competition not to conclude that competition is always inefficent. When such situations arise, we must turn our attention to the property rights, the trust and the "monitoring" which are supposed to guarantee the efficiency of competition, and seek ways to strengthen all of them or any one of them. I try to do this in the pages that follow.

4. Checks and Balances

The remainder of Section II deals with the benefits and the costs of competition: this subsection with intra-governmental competition and the next five with intergovernmental competition. In this section I ask and seek to answer the following question: Are checks and balances a "good" thing? There are at least two different ways of answering this question. One which is more formal, in that it focuses on structural features of political institutions, and a second one which is more behavioural in that it concentrates on the mechanisms and responses which characterize institutions marked by checks and balances, compared to those which are not. Because there is an element of truth in both lines of inquiry – although it will soon transpire that I accord more importance to the second – I will look at each in turn.

As the words checks and balances indicate, a system in which they play an important role is one in which more barriers have to be opened, more hoops jumped, more obstacles circumvented and more impediments negotiated in an effort to obtain the passage and implementation of a piece of legislation, than would be the case in a system in which they played a lesser role. From a static short-run point of view, checks and balances reduce the legislative and executive efficiency – defined as the ratio of laws passed and implemented to the time and effort put in passing them – of political institutions.

Looked at from another point of view, the reduced efficiency of law-making bodies is nothing but the greater popular control over the exercise of political power which is automatically achieved by the fact that checks and balances exist. In terms of this formal way of looking at the problem, one's view about the costs and benefits of checks and balances – and about whether they are "good" – centres one's conception of the role and importance of political power for the conduct of public affairs on the one hand, and on the extent to which that power should be controlled for the greater blossoming of individual and collective liberty on the other.

The virtues of efficiency versus control are not as easily described as the above formulation may inadvertently signal. Indeed, in some instances, liberty is guaranteed by a swift and unequivocal exercise of political power. For this reason, constitutions which recognize that there is a genuine trade-off between political power and liberty nonetheless acknowledge that that trade-off is not always "well-behaved" – that, in other words, it is sometimes subject to exceptions – by vesting in constitutions clauses which permit the rapid employment of power in emergency situations, such as that pertaining to "peace, order and good Government" in the Canadian Constitution.

From a structural point of view, parliamentary systems, such as the Canadian system, are characterized by far fewer checks and balances than are congressional systems such as the American. Thus from a short-run static or formal point of view, the Canadian political system, if we disregard its federal dimension, would seem to be more efficient at "making laws" than the American system, again neglecting the federal dimension. Or to put the point differently, political power is more controlled in the American political system than in the Canadian system.

However, the effective differences in the law-making efficiency of the two systems are not as great as one would have to conclude from an analysis of their structural characteristics. Should one impute the similarities in the two systems to characteristics of federalism or should one look elsewhere? There is little doubt that federalism has an important role to play in explaining the *de facto* similarity in the law-making performance of the two systems, but the second aspect of checks and balances that I noted at the beginning of the section is also of great importance.

This second aspect pertains to the dynamics of checks and balances. A system which places barriers and other impediments to the passage of legislation at the same time and in the very fact of forcing people to deal with the barriers and with the other impediments, stimulates discussion and debate on the matters to be legislated. It is as if the items remained longer on the agenda and consequently attracted the interest – voiced approval or disapproval – of a larger number of persons.

The people who develop an interest in discussing and debating matters kept on the agenda by the checks and balances are not only those who have a professional or para-professional concern for the matter – politicians, bureaucrats, lobbyists and others like them – but members of the general public, including academics, free-lance intellectuals, writers, social critics, organized groups and others. The greater involvement in public affairs which checks and balances generate will, in general, not be limited to haphazard intervention, but will stimulate the publication of magazines and other periodicals intensely concerned with the evolution of policy. It will, in other words, stimulate organized interest in public affairs.

Strong checks and balances will also mean that those citizens who get involved in public discussions and debates will want to engage in meaningful participation and consequently will seek to acquire more information on public affairs than professionals would of themselves freely choose to make available. The pressures for more information imply that over the longer term, the presence of more checks and balances leads to less secretive political institutions.

As a consequence, checks and balances, by raising the level of political involvement on the part of citizens, increase the legitimacy of the political process. Checks and balances still act to control the exercise of political power, but because, from a dynamic point of view, they raise the legitimacy of that political power, they make its exercise more efficient. The dynamic longer-term effects of checks and balances partially or even completely reverse the static shorter-term effects.

I wish to emphasize that the foregoing argument about dynamic effects reversing the static ones does *not* mean that law-making will be more rapid in systems with more checks and balances compared to those with fewer. The efficiency of checks and balances must be sought elesewhere. I mention two possible areas.

In a system with more checks and balances there should be fewer policy reversals over time. That is, changes in governments as a result of elections should produce fewer returns to the *status quo ante*. It is possible to argue, for example, that the cycle of nationalization and de-nationalization of certain industries which has taken place in Britain would not have happened if the British parliamentary system had had more checks and balances. This is a blatant case; the reader can surely provide some possibly less blatant but still spectacular cases in Canada.

A second area of increased efficiency of checks and balances due to the long-term effects over-turning the short-term one pertains to social consensus. More social consensus means that the difference between majorities and minorities have less saliency. As a consequence, other things being equal, it is easier to enforce laws. (The "other things being equal" relates to the desire or will of the population to have laws enforced, as revealed, among other things, in the amount of resources they choose to allocate to that task.)

The dominance of long-term over short-term effects is important. It provides part of the basis for the recommendation I made earlier for a reduction of party discipline in the House of Commons and in Parliamentary Committees for all non-budgetary matters. The reduction of party discipline would slow down the passage of legislation but, in the longer run, the benefits of this slow-down will be a more politically involved citizenry and policies and programs that are more broadly accepted by citizens. It is for this reason that I support the recommendations of the Commission's Report that are aimed at reducing and even eliminating the secrecy surrounding the budgetary process. I also support, for the same reason, the establishment of a permanent Economic Policy Committee of the House of Commons, which would hold annual pre-budget hearings and whose proceedings would be televised. In short, I support both recommendations because they increase checks and balances.

I deal with Senate reform later. I simply note here that any reform which increased the legitimacy of the Senate would automatically increase its ability to check and balance. Again, that would sometimes slow down the passage of legislation, but in the long run, through the process described above, it would increase the involvement and the participation of Canadians in public affairs. That must be deemed a net benefit. Checks and balances within our national institutions, as long as they are designed with care and prudence, are therefore of overall benefit.

What about the competition that is introduced in the political system through the medium of federalism? Is it also of overall benefit? That is the question to which I now turn. To proceed with the analysis, I distinguish between the competition which organizes the relationship of federal and provincial governments and that which structures the relationships of the provinces with each other. I call the first vertical competition and the second horizontal competition. I examine each of these under different aspects in the next five sections.

5. Division of Powers

Competition plays no role in the conventional approaches to federalism, whether these approaches derive from political science, law or economics. Competition is (unwittingly) removed by two assumptions which are both, in my view, unacceptable. The first of these, which will occupy my attention in this section, rests on a confusion between what could be called the *de jure* and the *de facto* division of powers. The second assumption, which I will analyse in Section II.7, relates to what may be called the territorial basis of interests and, hence, of community: the idea that federal states rest or are based on territorially more or less well-defined communities.

There can be little doubt that from a *legal-constitutional* point of view, an optimal assignment of powers is one in which the degree of concurrency, of overlap or of joint occupation of any one power has been reduced to a minimum. Constitutions that embody such an assignment are sometimes said to be the hallmark of "classical federalism". The need for the smallest possible degree of *de jure* concurrency does not originate in a desire for neatness, nor is it a relic inherited from the long-dying nineteeth century conception of political sovereignty enshrined in early definitions of federal countries as states constituted of two "sovereign and independent orders of government".

Instead, a minimal degree of *de jure* concurrency is required by the necessity of "judicial accountability". Ultimately, when things come to a crunch, a court must be able to decide whether a government has the authority to implement a particular policy or not; whether it is acting *intra vires* or *ultra vires*. If there is no "compartmentalization" within which legal authority can be exercised, there will be no basis on which a court can make decisions and, in fact, no meaning to a juridical division of powers. I will insist below that courts, and in particular the Supreme Court, are often called upon to act as "monitors" of federalist competition and to insure that competition is efficient. They cannot play that role unless the degree of *de jure* concurrency is small, for if it is significant, the courts would find it harder to impute responsibility to one or the other governments involved.[12] The fundamental democratic principle that parliament must be accountable becomes meaningless.

That much seems incontrovertible. But at the political or *de facto* level things are different: there, concurrency is the rule. We have to be clear about what that means if we do not want to become victims of the confusion between *de jure* and *de facto* concurrency which pervades the literature and which is used to argue against competitive federalism.

Before examining why an air-tight *de facto* division of powers is not possible in principle, let me illustrate the nature of the problem with a few examples. Consider the (welfare) economist's standard classification of powers into allocation, redistribution and stabilization, to which may or may not be added a revenue power, depending on how the first three have been defined. Now assume that for whatever reason, the redistribution and stabilization powers *de jure* are assigned to the federal jurisdictional level while allocation is somehow, again *de jure*, divided between the federal and provincial levels. If the division of the allocation powers is air-tight, we have a "classical" assignment of powers.

Now suppose that some provincial governments decide to use some of their allocation powers – those in areas such as education, transportation, or urban land use – in ways that fully respect the Constitution, but which change the distribution of income in a direction that the federal government does not like, so that that government feels obliged to implement policies of its own to "re-establish" the distribution of income it desires. Would not the air-tight separation of powers have *de facto* been broken? I believe so, since the federal government's actions are now governed by decisions taken at the provincial level.

Consider a second case. Suppose that to stabilize the economy the federal government increases or reduces some or all of the expenditures resulting from policies implemented under the allocation powers juridically assigned to it in a way that is respectful of classical federalism's dictum regarding concurrency. But, from a behavioural point of view, will it still be respectful of that division? Not if there is any relationship between federal and provincial policies, because if there is, decisions by the federal government will impact on the provinces, and, what is even worse, not equally.

We can now turn to general principles. As I hope the examples have made clear, the various day-to-day policies which can be implemented by the governments of a federation under the powers which have juridically been assigned to them, stand in all sorts of relationships to each other. In the way citizens look at these policies (formally, in the utility functions of citizens), some will be independent, while many others will be either substitutes or complements to each other. On the other side of decision making, in the way politicians and bureaucrats look at policies (formally at the technical level of "production" and implementation), policies will be independent, substitutes or complements, but not necessarily in the same way as they are for citizens.

That is the reason why *de facto* all powers tend to be concurrent. It is important to be clear about what that means and what it does not mean. It does not mean that both orders of government will, at the same time, legislate in the same policy area. It simply means that governments at the two jurisdictional levels will, in general, be legislating in policy areas that are closely related to each other. As noted, that "closeness" has two possible sources: the preferences of citizens and the technical properties of production and implementation technologies. In other words, policies can be related to each other in one fashion or another because of the way citizens value them; or they can be related, because their production and implementation connects them to each other. These connections create the *de facto* concurrency.

Once this is acknowledged, it is impossible not to recognize at the same time that governments at different jurisdictional levels will be in competition with each other. The competition originates in the desire of governments to obtain the support of citizens by providing them with the policies they want. Since these policies will not have the same relationships in the preferences of citizens and in the technical structure of the implementation techologies that they have in constitutional documents, governments at one level will be implementing policies which are substitutes or complements to policies that are the responsibility of governments at another level, hence the competition.

Does this *de facto* concurrency – the outcome of characteristics of policies and of the political process – imply that constitutions do not matter? That the juridical division of powers is meaningless? That any *de jure* division of powers would be equivalent to any other? The answer to these questions must be an emphatic no. There are better and there are worse *de jure* divisions of powers. There is a view – the outcome of the confusion between *de jure* and *de facto* concurrency – which holds that the best constitutional assignment of powers is the one which leads to the smallest degree of competition possible. The bookshelves of Canada's libraries are littered with constitutional blueprints aimed at working out a division of powers that would eliminate *de facto* concurrency, so as to eliminate federalist competition.

Such constitutional blueprints are impossible to design for the only reason that people and the environment change. A blueprint that succeeded in assigning powers so as to suppress competition today would be obsolete, in that respect, tomorrow. What then is the optimal constitutional division of powers? To answer that question would take me too far afield. In addition, it is not, for the issues that concern me here, of prime importance; consequently I skip over the question.[13]

6. *Executive Federalism*

The discussion of the last section clearly acknowledges the existence of interdependence. Indeed, it associates interdependence with two prime sources: the preferences of citizens and the characteristics of "production and implementation" processes. The question I address here is whether that interdependence calls for federal-provincial co-operation and co-ordination.

The question is easy to answer. To the extent that interdependence originates in the properties of the preferences (utility functions) of citizens, there is no need for formal institutionalized co-ordination. Indeed, one should rely on vertical competition between governments at different levels to deal with the co-ordination problem. The rule is the same as for market co-ordination. That is one reason why in its day-to-day operations federalism tends to be "messy", but one should keep in mind that it is this messiness which is the secret of its efficiency!

When we turn to the interdependence on the production and implementation side, there is a strong case for formal federal-provincial co-ordination. That is the limited case for Executive Federalism. The co-ordination activities are embodied in federal-provincial committees which involve various levels and various departments of governments, all of which seek to find better ways to "produce" and implement the policies which have been decided upon and designed by the political arm of governments.

There is a real temptation, reinforced by the internal logic of parliamentary government, to extend executive federalism beyond production and implementation questions to the elaboration, formulation and design of policies. If the temptation is not resisted – and it must be acknowledged that many times in the past it has not been – Executive Federalism serves to reduce the beneficial effects of competition.

For this reason, I believe it is important that *federal-provincial consultation on virtually all matters follows, not precedes, debates in the House of Commons and in provincial parliaments. Parliamentary debates should extend to a specification of the areas that could be reasonably co-ordinated and those which should not be.* This kind of sorting is currently undertaken at the Cabinet level. Bringing these matters before Parliament would increase checks and balances and hence democracy. It should be favoured on that ground. Furthermore, *it is essential that such matters be debated publicly if a reformed Senate is to perform its "monitoring" role efficiently.* To those who argue that this will slow down the decision-making process, I reply with the argument developed earlier, that such a procedure will increase public involvement in public affairs and, over the longer term, will make for a more politically mature citizenry.

But a more intense involvement of parliament in the policy design of federal-provincial matters and a restriction of executive federalism to "production" and implementation of policies are not sufficient for efficient competition. *Efficient competition also requires that more information be available to the public,* not only on the federal-provincial and provincial-provincial policies that are co-ordinated, but on the nature and form of the co-ordination. At present, in the *Access to Information Act*, federal-provincial communications are accorded a status equal to that of national security. That is ludicrous and should be changed.

7. The Territorial Basis of Interest

The search for a basis that would make it possible to define a community has absorbed much time and effort in the last two or three centuries. Such a search has had many motivations, some more noble than others. One of these has been the belief that some notion of community was a necessary adjunct to the definition of the still dominant, and not receding, idea of the nation-state. Community was therefore sought along cleavages or lines of demarcation between people such as race (colour, blood and cranial measurements having been the most important indexes of race), language, ethnicity, religion, and in more recent times, culture and "society", these defined in purely socio-institutional terms.

Much of the reflection on federalism developed in juxtaposition to that on the nation-state. In addition, federalism appeared to some as a way of salvaging the idea of community, based on whichever cleavage was cherished at that moment, together with the notion of some minimum efficient size of country. It is not an accident, therefore, that in much of the literature on federalism – even fairly sophisticated literature – federalism as a "community of communities" or as a compact, a confederation or an alliance of communities based on particular cleavages, keeps coming up.

In Canadian thought, this intellectual atavism has nourished two dominant views of what may be called communitarian federalism and a number of minor derivatives which it would serve no purpose to even acknowledge. The first of these dominant traditions, and by far the one with the highest profile, asserts – in language that has changed as times and circumstances have changed – that Canada is made up of two "peoples", "two races", "two cultures", or "two societies". According to that view, the fact that there are ten provinces in Canada is seen either as an illusion – a way of shifting attention away from the cherished dichotomy – or as a sinister ploy to deprive one of the peoples-races-cultures-societies of its identity (one that is redefined as the terms of the dichotomy are re-defined).

The second major tradition of Canadian communitarian federalism acknowledges the fact that there are ten provinces in the country, and goes on the assert that they constitute ten communities. History has played havoc with the first or "dichotomy" tradition as the constant change in language indicates. But things are worse for the "ten-provincial-communities" tradition, if only because any definition of society and culture that has the barest elements of operational significance will not be applicable at the same time to the provinces and to the nation. In other words, if one adopts a definition of culture or society that makes Alberta, Ontario, Quebec and Newfoundland – the provinces most often mentioned – into distinct communities based on cultural or societal dimensions, then on that definition Canada will not be a community.

Before indicating why we must divest ourselves of these atavistic intellectual notions, let me note one implication of the doctrine of communitarian federalism. Since the communities are based on race, language, culture, or whatever, there is no place for horizontal competition between the various provincial governments, because a provincial government, which is assumed to be catering to a community of individuals whose preferences are assumed to be defined by communal characteristics, will be able to do very little, if anything, of interest for individuals of another community whose preferences are defined on an altogether different set of communal characteristics. And, may I add, as a matter of logic, the federal government is superfluous, in that system. It is true that it has a role to play in the "dichotomy" tradition where it is seen as the government of one people-race-culture-society, replacing the nine other superfluous provincial governments!

Horizontal competition has no role to play in a model of communitarian federalism because that notion of federalism is always used as a device to collectivize interests. To put it differently, the notion of community is used as an instrument to make the interests of Manitoba dominate those of Manitobans and the interests of Prince Edward Island those of individual Islanders. Consequently, only the government of the community can know the interests, preferences and aspirations of the community. Other governments, not being of the "proper" race, blood, language, religion or culture, are by definition strangers to these interests. It is a neat assumption to use to remove competition.[14]

It is essential to acknowledge that provinces are made up of people, some of whom have traits that are similar to those of other people in the same province and in other provinces, but also of some who have dissimilar traits. There is no province in Canada that is made up of a homogeneous mass of people and there is no province in Canada in which the interests, preferences and aspirations of all the people are the same. And it is to be hoped there never will be.

But even if there were, even if the people of Canada were sub-dividable into *x* or *y* homogeneous globs of humankind, that would not furnish us with a rationale for a federal state. That rationale, as the *Federalist*[15] in the great debates that preceded the Philadelphia Convention of 1787 recognized, is to provide the political system with more (additional to those in each government) competition to insure that over the long run, political power is exercised both efficiently and legitimately in the interests of citizens. In a political system based on parliamentary rules of the game, the importance of additional competition cannot be over-emphasized.

The foregoing is *not* a denial of the existence of communities. I recognize that these exist and that they play an irreplaceable role in the life of people. Without the communities provided by families, professions, workplaces, churches, associations and groups of various sorts, anomie, disintegration, and even a Hobbesian "war of all against all" would be the norm. I am only saying that there is no independent definition of community that can serve as a guide to the design of federal structures and to their governance. *The task of governments is to meet the preferences of citizens who happen to be in the provinces or in the country they have been elected to govern.* Meaningful provincial communities do not exist, except as provinces.

8. Nation Building and Province Building

Earlier, in Section II.3, I noted that unless property rights are well-defined, unless trust is sufficient or unless "monitoring" is efficient, competition will not produce the beneficial results which it can be expected to produce. I repeat that it is possible to have property rights that are so inappropriately specified and/or so poorly enforced, to have such a lack of trust, or to have "monitoring" that is so inefficient, that the effects of competition will be perverse. This is therefore a central issue. In this subsection, I look at some of the factors that govern or at least should govern horizontal competition. In Section II.9 I turn my attention to the same question for the case of vertical competition. I must insist immediately on two points: first, as I have already noted, it is not possible, given the present state of knowledge and research, to describe all the conditions – those necessary and those sufficient – that make for efficient horizontal political competition in a federation; second, in the discussion on the division of powers (Section II.5), on executive federalism (Section II.6), and on the territorial basis of interest (Section II.7), I have already indicated some of the conditions that are necessary for efficient competition. Those that follow are additional.

The first of these conditions pertains to a notion of "competitive equality". To be sure, efficient horizontal competition does not require that all competing units be of equal size any more than efficient competition in markets requires that firms be of equal size. But it must be that the large units are not in a position to continually dominate, coerce, and in other ways prevent the smaller units from making independent autonomous decisions; nor are they in a position to inflict "disproportionate" damage on them. The smaller units must be able to compete with the strong on an equal footing. This problem is more acute in some federations than in others, and is certainly an important one in the Canadian federation in which the disparity in the size of provinces is large and possibly growing.

The responsibility for insuring that the smaller units are able to compete against the larger ones cannot lie elsewhere than with the federal government. That is a first reason why the central government is different from provincial governments. How does the central government play this role or fulfill this responsibility? Before answering this question, let me note that it cannot be an easy role to play, because, as I have already indicated, the federal government, also competes with the provinces. We are faced with the situation in which a government, competing with those at another level, must act to insure that the competition between the latter is "fair" and "productive". That is necessarily a difficult task, one that cannot be left exclusively to the day-to-day push and pull of politics, but must be institutionally entrenched. I discuss the problem in Section II.9.

Conventional wisdom about public policy in Canada is overlaid with the words "nation-building" and "province-building". When the view is not made explicitly, it is implicit that nation-building is the business of the central government, while province-building is that of the provinces. I would like to suggest that a look at the record would indicate that that attribution is largely wrong: the central government in Canada (and I would submit in other federal countries also) has been and continues to be engaged in province-building as much, if not more in certain instances, than the provinces themselves. That is one of the ways it acts as a "monitor" of horizontal competition.

How does the federal government foster province-building? It is not possible in this brief statement to indicate all the ways this is done. It will do if I give examples taken from various modes of interventions to illustrate what I mean; the reader will then be able to provide more examples for him or herself.

One notorious example of federal province-building was the creation of the Borden Line, the line which forced a differential price in oil and oil products, such that the prices east of the Ontario-Quebec border were lower than those west of that line. The policy permitted the development of an oil industry in Western Canada at a time when the pure economics of the case would not have permitted that to happen. Although it was not called province-building, nor labelled regional policy either, there can be no doubt that the policy played that role, and quite effectively so.

A second example of province-building is the entire set of policies which have come to be labelled regional policies and over which there is still so much uncertainty and controversy. An analysis would indicate that the federal government has always pursued regional policies: it has always tailored or adjusted relevant policies to regional or provincial realities. However, the modern development of regional policies begins in the post-war period, more exactly in the 1950s, and continues to expand and grow until the present. This is not an accident. If one of the roles of regional policy is to insure that the smaller and least favoured provincial governments are able to compete with the larger and more favoured ones, it must be that regional policies will grow and acquire more significance as the intensity of competition increases. The most casual observation confirms that the extent and the degree of horizontal competition in the Canadian federation have grown enormously in the post-World War II period as the provinces have "come of age". This coming of age has manifested itself in a number of ways, not the least of which is the increase in the size of provincial budgets – relative to the total of public expenditures – and the development of competent, mature provincial bureaucracies.

A third example of province-building policies by the central government – that is, of policies which make all provincial governments, if not equal, at least capable of horizontal competition that is efficient and productive – is equalization payments. These grants, to which I devote some discussion in Section III, are primarily an instrument aimed at improving the competitive position of the weaker *governments* of the federation and ameliorating the productive features of the competition in which they are engaged *vis-à-vis* other provincial governments. They are not instruments aimed at achieving "horizontal equity" between the inhabitants of the provinces. This does not mean that considerations of equity and of narrow (neo-classical) economic efficiency do not enter their design. But these grants would be of minor importance if their primary role of acting as province-builders was set aside. That is why it was appropriate for the federal government, after the increase in the price of crude oil that made the Ontario government a "have-not" government, to change the equalization formula so that government remained a "have" government: in the competitive game, it is hard to imagine that the Ontario government is not a "have" government.

One could continue giving examples, (for example, transportation policy, procurement policy, etc.), but the point, I hope, is made. Before moving on, I stress two subsidiary points. First, the fact that the various programs I have listed to illustrate the nature of province-building by the federal authorities exist, does not mean that they cannot be improved. Therefore, the fact that the federal government engages in province-building activities does not tell us whether it does too much or too little of it. The second point, which I mention only to remove all ambiguity, is that even if the federal government pursues province-building policies, this does not mean that the provincial governments do not also pursue policies aimed at the same end. Furthermore, province-building policies, whether federal or provincial in origin, contribute to nation-building. These obvious points have to be made only because the conventional dichotomy between nation-building and province-building tends to obscure them.

Besides competitive equality, another condition, this one pertaining to the appropriability of costs and benefits of public policies, must be satisfied. (A not dissimilar condition must also rule in markets if competition there is to be efficient.) The condition requires that the benefits and costs of decisions made by the government of a province be borne by the people living in that province, and, therefore, by the government of the province. This condition is particularly relevant for costs, so let me re-state it with respect to that variable. In competing to attract businesses to its jurisdiction, either by supplying particularly attractive local public goods, such as theatre, concerts, or dance, by offering tax advantages, or by buying part of the ouput of the sought-after enterprises, the government of a province should not be able to shift the burden of the offered amenities to the citizens of other jurisdictions. It is clear that otherwise the competition would be inefficient. There is already considerable machinery in place in Canada to ensure that benefits and costs are appropriated by decision makers themselves. This is particularly the case in the field of taxation. But there is room for improvement. I will return to this question when I address the issue of "economic union" in Section III – a matter that is important enough in our terms of reference to have given the Commission part of its name.

Were I engaged in writing a formal treatise instead of presenting a broad framework that can help decide on appropriate policies, I would devote considerable space to another condition for efficient competition which could be called "entry". For competition to be efficient, those who can elicit more suppport should be able to enter the competitive arena and those less effective at doing that should have to leave it. Although there is some evidence – mostly American – that the life expectancy of political incumbents has been increasing, it is not known whether that phenomenon is "natural" or contrived.[16] Should future research indicate that anywhere in the Canadian federation, entry by existing or new political parties to the apparatus of state is reduced by artificial contrivances, that would be a matter for serious concern, because that would greatly reduce the competitive nature of Canadian politics, not only between parties, but overall.

The matter is particularly important in respect of electoral rules, because these may, under certain circumstances, prevent the representation of groups of citizens in political institutions. There is some weak evidence that the operation of electoral rules in Canada, both nationally and provincially, may be artificially lengthening the tenure of incumbents. If that is ever seriously documented, these rules should be altered.

9. Who Monitors the Monitor?

"Who monitors the monitor?" is the most fundamental question of economic, social and political organization. It was raised in the first century of our era by Juvenal (nam quis custodiet ipsos Custodes?) and continues to be asked to this day.[17] It is a fundamental question, but, ironically, it is one that possesses no satisfactory logical answer. For, indeed, if one finds a monitor (guard) who will guarantee that an appointed monitor (guard) will do an assigned job well, how are we to know that the first monitor will do his or her job the way it should be done? Economists have been somewhat cavalier with the question, and, given how hard it is to answer, they are somewhat justified. They have usually assumed that the state should monitor property rights, competition and market behaviour, but have seldom asked who should or would monitor the state. Economics, indeed, has no worthwhile theory of politics.

I suspect that it is this fundamental question, lurking in the back of people's minds, which is the biggest impediment to an acceptance of the obvious fact that democratic politics is competitive. The idea of competition is, of course, intimately related to the notion that individuals pursue their own interest. If politics is competitive and driven by self-interest, who will monitor politics? To assume that politics is not competitive, or should not be, has been the classical way out of the problem. The assumption will not do and, indeed, has never done.

Historians report that when the Fathers of the Canadian federation met in Quebec City and in Charlottetown in 1864 and 1867, as well as when the Constitutional Convention met in Philadelphia in 1787, the debates on the division of powers in both cases took very little time. Agreement was reached almost immediately on the conviction that the proposals envisaged were reasonable, and that in any case, marginal changes in the division of powers could be achieved subsequently either formally, informally, or by judicial interpretation. The wisdom of both groups of Fathers has been vindicated by history.

What required much time and debate and was the source of intense bargaining in both cases was the Senate. To my knowledge, why things happened that way has not been considered, nor has an explanation been provided of why the structure of the Senate mattered so much to these wise men. The explanation, I wish to suggest, rests on the fact that senates play an absolutely central role in "monitoring" the vertical competition that exists in federations – the competition between the federal and provincial (state) governments. Because of that central role, it is desirable that senates be designed so as to guarantee that competition is as fair and as unbiased as possible. In my view, the Americans understood this,[18] whereas the Canadians did not; they were too British in their outlook to understand federalism and the role of a senate in that form of political organization.

The Senate acts as a "monitor" of vertical competition by injecting a provincial dimension in the central government. In a well-functioning federation, although it would always be an integral part of the central government, a senate would in some important sense be related to both orders of government. The Supreme Court was therefore right, and revealed a profound understanding of federalism, when it recently argued that the federal government could not alone, that is, without the provinces, change the basic structure of the Canadian Senate.

It is interesting to note, in passing, that the New Democratic Party as well as its predecessor, the Canadian Commonwealth Federation, have consistently favoured, not the reform of the Canadian Senate, but its abolition. One must also acknowledge that these parties – less so in recent years than in the past – have often been luke-warm *vis-à-vis* federalism as a way of organizing politics.[19] I find great logic in that position, and, to me at least, it confirms that in a federation, a senate has an important "monitoring" role to play. To the extent that federalism becomes absorbed in the interstices of NDP thought, I would expect that party to move from abolition to reform of the Senate.

A senate can only play a "monitoring" role if it has legitimacy, and, in our time, *that can be achieved only if it is popularly elected*. Comparisons with the House of Lords in the United Kingdom are beside the point. The United Kingdom is not a federation and therefore whether the House of Lords has legitimacy or not cannot be an impediment to a role of "monitor" of vertical competition.

However, legitimacy is not enough. If a senate is to inject a provincial dimension in the federal government and thus become capable of "monitoring" vertical competition efficiently, *the basis of representation must be provincial*, not regional, as is current practice. The persistent confusion between provinces and regions that one encounters in the literature and in public debates is a close cousin, I believe, to the notion that interests are communal. The size of provinces and the location of their frontiers are not "rational" in any real sense of that term, but they are there and they determine the jurisdictions of provincial governments.

There is a growing recognition in Canada that the basis of representation in the Senate should be provincial, but there seems to be no rationale underlying this developing awareness. Because the notion of provincial representation is not derived from a well-structured theory of federalism, but appears to be no more than a component of the current Zeitgeist, it could be as fleeting as all Zeitgeists. It is therefore important to know why provincial representation is better than regional representation.

The House of Commons is elected on the principle of popular representation: that is as it should be. But if the Senate is to "monitor" vertical competition efficiently, it must be elected on a different basis. *The best rule would be, as is the most common practice in other federations, to make all provinces equal*. Thus, each province could elect ten or twelve senators. The current practice is not only inefficient, it is perverse, since it gives more, considerably more, senators to the large regions (provinces), thus adding to the "competitive inequality" that is inherent in size differences, however measured. It is hard to imagine that the larger and more powerful provincial governments – Ontario and Quebec – would accept changes in the rules of the game that would oblige them to compete more fairly with Manitoba and Prince Edward Island; but without being an incurable dreamer, one can hope that the genuine sense of fairness that characterizes Canadians may, one day, induce these governments to adopt such a change.

The primary role of the Senate should *not*, therefore, be that of a "chamber of sober second thought", although it would continue to play that role. *Its primary role should be to give saliency to the provincial dimensions of public policies*. I stress that this is not essentially a representation role; it is a "monitoring" function. In other words, in the competition over resources and policies that takes place in the national government, it is imperative, if the competition is to be efficient, that provincial interests be competing with each other on an equal footing. It is not sufficient, to put it still differently, that provincial interests be represented appropriately in national debates. They must be able to vie with each other on a basis of "competitive equality"; otherwise the checks and balances that characterize national politics will be biased against the weaker provinces, even if their points of view are represented. A capacity to compete is more than a capacity to talk; it is also, and radically, a capacity to exert a real influence on decisions. That is the real meaning underlying the notion of "monitored" competition.

To fulfill its "monitoring" role, the Senate should keep some distance from the House. This would be achieved *if the Senate was not elected on the same basis as the House*. I have already noted that the basis should be provincial and that equal representation of the provinces should be the objective. In addition, *it would be best if the Senate was elected on the basis of proportional representation, at fixed intervals and for fixed periods*. If these were the rules, the distance between the House and the Senate would be great enough to insure that the Senate could "monitor" vertical competition effectively. If the distance was any less, it would be too much a creature of the House of Commons to do effective "monitoring".

It has often been suggested that the Senate be given a six-month suspensive veto. That raises a difficult problem. A suspensive veto, it would seem, is not consistent with legitimacy acquired at the ballot box. Elected Senators are unlikely to be satisfied with a temporary delay, especially if the matter is a pressing one. At the same time, it is important to leave the matter of confidence in the Cabinet with the House. What should be done? I think that it would be best if the Senate was not given a suspensive veto. *Instead, a bill that was amended or defeated in the Senate should be passed anew by the House of Commons*. That would leave the ultimate power with the House, and would be conducive to bargaining between MPs and Senators. A suspensive veto does not encourage compromise.

The Senate is not the only national body that serves to "monitor" vertical competition. That is also done by the Supreme Court. It is that body which interprets the division of powers and determines the competitive behaviours which, from a legal point of view, are constitutional and those which are not. In the absence of an efficient Senate, the burden which must be carried by the Supreme Court, in its role of "monitor" of vertical competition, tends to be too heavy. However, the remedy for the problem is *not* to reform the Supreme Court, as some have proposed, but to reform the Senate.

III. Applications

A theory of competitive federalism, such as the one adumbrated in the foregoing pages, has great power not only in providing an integrative and unifying framework to matters which otherwise appear not to have any meaning and consequence, but also in making it possible, as I hope I have already shown, to address matters of institutional reform in other than a purely *ad hoc* fashion. That is true in respect of Senate reform, a matter that has provoked countless suggestions, not many of which, however, are anchored in a strong rationale related to the purpose or role of that body. That is also true for the institutions of Executive Federalism and for regional development policy, a subject to which I return below.

In the discussion that follows, I wish to demonstrate the power of the theory by applying it to sundry issues that have been raised in one locality or another during the Royal Commission's hearings. These are usually matters on which there is considerable debate, that is, matters which are difficult to discuss because of the lack of a consistent framework of analysis. Applying the theory of competitive federalism to these questions and deriving the recommendations for reform which seem to follow from it will shed more light on the approach.

I will look at five questions which are "natural" questions for a theory of competitive federalism. Because neither time nor space allow an extensive and detailed treatment, I will only sketch the problems and point to the solutions. The reader will have to supplement the development with his or her own insights. I will examine the following five questions in the order indicated, although that order is not an index of significance or of saliency: 1) economic union; 2) intergovernmental grants, that is, equalization payments and established program financing; 3) Tax Collection Agreements; 4) the Charter of Rights and Freedoms; and 5) municipal governments.

1. Economic Union

Economic development policies, of which industrial and regional policies are a sub-set, now play an important role in the policy arsenal of every jurisdiction. Many times, of course, they are not called by that name; they may even be implemented as a part of other policies. For example, it has been said that industrial and regional considerations play a significant role in the defence and military expenditures of the United States government;[20] it is, in any case, a fact that the Pentagon publishes yearly a map which displays defence expenditures by congressional districts!

These economic development policies are, as I have already argued, the product of federalist competition, but in two different senses. First, some of these policies are responses by federal and provincial governments to opportunities created either by the demands of citizens or by comparative public entrepreneurial capacity. For simplicity, I will call these demand-supply development policies. Secondly, some policies are implemented, mostly by the federal government, but not inappropriately also by both orders of government acting together, to ameliorate the degree of "competitive equality" between the provinces of the federation in order that competition between them be more efficient and productive.

It is absolutely essential to keep the above distinction in mind in analysing industrial and regional policies, and, more generally, economic development policies. The distinction is a feature of federations which is absent from unitary states. In the latter, indeed, the only source of economic development policies is demand and supply considerations; the establishment of property rights aimed at making federalist competition efficient is, by definition, absent in these political structures.

Though it is important to distinguish between the two identified "sources" of development policies, it is also indispensable to keep in mind that they are not independent of each other. The relationship between them can be put in the following way: the more efficiently designed the economic development policies that serve to promote "competitive equality" and thus to "monitor" federalist competition, the higher the benefit-cost ratio of development policies implemented in response to demand-supply considerations.

To see why that must be so, we must first identify the benefits and the costs of the development policies I have called demand-supply policies. The benefits are easily ascertained, at least for those who assume that when governments respond to what people want, they raise the well-being of these citizens.

The costs arise because economic development policies almost invariably create impediments or barriers to the free movement of goods, services (for example, the services of lawyers, nurses, etc.), labour, capital and entrepreneurship. These barriers – in the present discussion solely a by-product of responses to the demands of citizens – reduce the specialization that would otherwise be achieved in the use of scarce resources. It is these barriers that constitute the "economic union problem".

The affirmation made above that if the economic development policies designed to "monitor" federalist competition are efficient, the ratio of the benefits and costs just defined would be maximized, rests on the notion that federalist competition is a self-corrective mechanism. To put it differently, federalist competition, like all competition, if it is well "monitored", is efficient in the sense that it will economize on scarce resources in achieving the objectives willed by people. Indeed, efficient "monitoring" means, among other things, that costs imposed on others in the competitive pursuit of a target must be proportionate to the benefits obtained. In addition, self-correction or restraint is brought about by the fact that under efficiently "monitored" federalist competition, the benefits of economic development policies are closely related to their own costs.

If the above analysis is correct, it has one empirically testable implication: there should be more inefficient barriers to the free flow of resources in unitary than in federal states. In unitary states, indeed, the discipline of competition is much weaker, and the obligation to meet the preferences of citizens less constraining. I should insist that to test the proposition, one must focus on demand-supply development policies, and exclude from the analysis those policies implemented to make federalist competition efficient. It is not an easy proposition to test, but my own casual observation of both unitary and federal states supports the proposition.

In the Canadian context, "monitoring" is not as efficient as it could be, not only because the Senate does not interject the "proper" provincial dimension in federal institutions, but because Executive Federalism is too "encompassing", and because of other reasons, some of which have been noted above. Consequently, the economic development policies that should serve to improve "competitive equality" and to make federalist competition more productive are less than optimal; and the benefit-cost ratio associated with demand-supply policies is lower than it could be.

What should we do to correct that situation? The best solution is to reform the Senate and the institution of Executive Federalism along the lines recommended earlier, as well as implement other measures, such as those suggested in this supplementary view, that would make federalist competition more efficient. If this was done, the only other things that would be needed would be to implement the recommendations of the Commission's Report pertaining to section 121 of the Constitution Act and those relating to interprovincial trade.

If significant institutional reforms cannot be achieved, then *as a second-best solution*, I support the Report's recommendation that a Federal-Provincial Commission on the Economic Union be established to implement a "Code of Economic Conduct" that would be a "monitor" of the economic union. My own version of the code, would, however, require that the distinction made above between what are in effect "framework" policies and demand-supply policies be entrenched and respected. The code would then be aimed at restricting the implementation of demand-supply development policies that have an "obviously low" benefit-cost ratio. The code should seek to achieve through administrative and bureaucratic means what, in a more ideal situation, would be the "automatic" outcome of the operations of Parliament, federal-provincial machinery, and federalist competition.

2. Intergovernmental Grants

All theories of intergovernmental grants reflect or are derived from some theory of federalism. That thought may seem obvious, but it bears repeating, because there are many theories of government grants which present themselves as independent of any conception of federalism. I do not have the time nor the space to demonstrate that point here; that will have to wait. It will be clear, however, that the theory of grants that follows is an integral part of the theory of competitive federalism. It does not rest on such intractable and pious notions as "Canadians are a sharing people" or "Canadians are compassionate"; it does not, in other words, derive firstly from notions of equity, because if equity was the basis for governmental grants, one would be led immediately to the view that transfers should be made to persons, not to governments.

I have already indicated that the role of government grants is the promotion of "competitive equality" between the provincial governments of the Canadian federation. The purpose of this section is to amplify this point. I consider equalization payments first, and then turn my attention to the financing of established programs.

I must repeat that in a federation, the competition that I have called horizontal takes place between the *governments of the federation*. Equalization payments are aimed at making that horizontal competition work more efficiently. That rationale is not inconsistent with section 36(2) of The Constitution Act, 1982 which says that equalization payments are made "to ensure that provincial governments have sufficient revenues to provide reasonably comparable levels of public services at reasonably comparable levels of taxation".

An efficient equalization formula redistributes tax revenues between provincial governments but, importantly, it does so according to certain (temporarily fixed) rules and thus acts as an "automatic monitor" of horizontal competition. Equalization payments, therefore, allow weaker provincial governments to "hold their own" *vis-à-vis* stronger ones in federalist competition; but also, they serve to deter any provincial government from engaging in competitive actions that would be privately beneficial to itself, but socially inefficient and destructive.

Let me give an illustration of this last point. Suppose that a provincial government sought, through predatory behaviour, to attract the head offices of corporations to its province, so as to increase corporate profits in the province and hence revenues from that source. In the absence of an equalization formula (or of other "monitoring" devices), such action, even if destructive, could be profitable to the province. But an efficient equalization formula would produce a reduction in equalization payments to the province and would thus deter such predatory behaviour. It is clear that the deterrent should not be absolute; indeed, it should be incremental. It is also clear that an efficient equalization formula need not subject all provinces to the same marginal deterrence. The current formula, based on a five-province standard, is different in that respect from the older formula which was based on a ten-province standard, but it is not necessarily inferior to it. To come to a decision on the matter requires a judgement about the relative competitive ability of provincial governments.

Equalization payments do redistribute income but their primary rationale and their prime function is allocational. It is because of this allocational role that equalization receives the support of all provincial governments, those of the "have" and those of the "have-not" provinces. It is also because of the allocational function that equalization payments have to be unconditional; if they were not, they would suppress federalist competition.

In this regard, it is important to stress that an efficient equalization formula should "monitor" competition, not seek to eliminate it. Suppose, for example, that a provincial government, as a result of some fortuitous or deliberately sought event, benefits from a windfall revenue which would permit it to compete more effectively with other provinces for resources and people; should the equalization formula redistribute all of this windfall between the provincial governments and thus impede federalist competition? Certainly not. Such a provincial government is indeed in the same position as a firm which, following a favorable event, is able to expand its clientele at the expense of other firms.

Those who would suppress federalist competition in that way usually embrace a Benthamite notion of government, according to which governments act in the public interest because the public interest is their business, and because to be in public life is to be motivated by the public interest. When governments are assumed to always maximize social welfare functions, why have competition, indeed, why have governments in the first place?

I note in passing that the view of equalization grants advanced here is, broadly speaking, the one to be found in the *Report* of the Royal Commission on Dominion-Provincial Relations, commonly known as the Rowell-Sirois Report. It is true that that Commission's conception of federalist competition appears to be different from mine, at least on a first reading: it seems to be arguing that federalist competition is essentially destabilizing and destructive. That Commission's views reflect the analysis of the realities of interprovincial fiscal competition during the 1930s, as well as the prevalent idea of the period which viewed competition as generally inefficient even in markets.

The "monitoring" role of the federal government in the 1930s was by any reckoning quite limited. It is intriguing that Rowell-Sirois recommended the introduction of National Adjustment Grants (NAG), admittedly different from, but close in spirit to the present equalization grants which I argue make competition more productive. The Commission also recommended that the NAG be unconditional. The rationale for its recommendation, though shunning the language of competition, is so suffused with its spirit that it is worth quoting at length:

> *It should be made clear that while the adjustment grant proposed is designed to enable a province to provide adequate services (at the average Canadian standard) without excessive taxation (on the average Canadian basis) the freedom of action of a province is in no way impaired. If a province chooses to provide inferior services and impose lower taxation it is free to do so, or it may provide better services than the average if its people are willing to be taxed accordingly, or it may, for example, starve its roads and improve its education, or starve its education and improve its roads – exactly as it may do today. But no provincial government will be free from the pressure of the opinion of its own people and if, when it applies for an increased adjustment grant on the basis of need, it has to produce figures which indicate that although it might, without specially heavy taxation, have provided better education but did not do so, it has, of course, to justify this to its own voters.*[21]

But, given the *Zeitgeist* of the period, the Rowell-Sirois Report could not imagine that, even after the implementation of the NAG, the federal government would become a true "monitor" of horizontal federalist competition. For that reason, it proposed dealing with competition by re-assigning taxation and significant expenditure powers to the federal government. That was the solution adopted everywhere at that time. It rested on a confusion between competition and the mechanisms that insure its efficiency: property rights, trust, "monitoring", and so on – a confusion which still today is far from fully exorcised.

That notwithstanding, there is still something that we can learn from the Rowell-Sirois Report and from section 36(2) of the Constitution Act which reflects that Commission's view of NAG. To put it as simply as possible, the current equalization formula reflects only the revenue needs of provincial budgets. *Competitive equality would require a formula designed to reflect expenditure needs as well*, but only if the costs of incorporating the expenditure side in the equalization formula do not exceed the benefits.

Equalization grants are negotiated grants; the negotiating parties are the federal and provincial governments. Because these grants are aimed at improving "competitive equality" between the provinces, the role of the federal government cannot be symmetrical to that of the provinces, for if it was, the outcome of the negotiations could easily be more competitive inequality instead of more competitive equality. Indeed, a neutral role on the part of the federal government would eliminate the "monitoring" function that must be played by the central government. In some circumstances, it may even be necessary for the federal government to act unilaterally as it did a few years ago, that is, to forego all negotiations with the provinces.

The Established Program Financing agreements, as they currently exist, are of a class and kind that is altogether different from the equalization payments. Their intent and purpose is to limit and even to eliminate interprovincial competition in certain areas. Whether that is good or bad is not at issue here. (In fact, I support the recommendation of the Commission's Report that the mode of financing of education be changed with the aim of increasing interprovincial competition at the level of post-secondary education.)

But if, for any reason, the federal and provincial governments choose to restrict horizontal competition in certain domains, such as is presently done in health and education, *then the grants used for that purpose must be conditional grants*. The situation in which we currently find ourselves regarding this matter derives from the fact that the grants are unconditional. Unconditionality, in turn, is the product of a reliance on a theory of intergovernmental grants in which the decision makers are neither real governments, nor competitive.

The problem which unconditionality creates is analogous to a "free rider" problem. By agreement and by choice of financial instruments, federalist competition is suppressed in, let us say, post-secondary education. The device used to suppress competition is "national standards" or "minimum standards". Since competition is eliminated, unconditional money will not be spent in that area, but will tend toward areas where competition is greater. Consequently, "national standards" are not achieved, federalist competition is distorted, and federal-provincial relations soured.

3. Tax Collection Agreements

There are substantial real economies of scale in tax collection. It is not clear and certainly not known whether these economies persist over all the taxable units in the country. But it is not impossible that they do. There are therefore advantages, possibly large, to the Tax Collection Agreements whereby the federal government collects personal income taxes for all provincial governments (except that of Quebec), and also collects the corporation income tax (except for the governments of Alberta, Ontario and Quebec).

The economies of scale derive from many sources. Not unimportant among them are the following: the tax bases used by all parties must be defined in the same way and, secondly, though tax rates can differ, they cannot differ by much. The Tax Collection Agreements therefore serve as a way of reducing tax competition between the provinces and possibly between the provinces and the federal government. The economies of scale in tax collection are not, therefore, dissimilar to the economies of scale that would result if dress manufacturers were to sign a Fashion Standardization Agreement whereby dress styles and designs would be restricted and differences in them greatly limited.

The analogy is appropriate not only in illustrating how the Tax Collection Agreements restrict competition, but in indicating why so many tax experts think they are a good thing! It is, indeed, only recently – some thirty to forty years after the introduction of "monopolistic competition" as a model of markets in which businesses compete with each other through the medium of fashion and product characteristics – that economists openly acknowledge that product differentiation may raise economic welfare instead of always reducing it.

The point can be put differently. There are often costs, in addition to advantages, in exploiting economies of scale. In the case under consideration – the Tax Collection Agreements – the benefits of standardized tax bases and (to some extent) rates are readily appreciated. The costs resulting from restriction of competition and over-standardized bases and rates are, however, no less real even if less direct and palpable.

The foregoing does not mean that tax collection agreements should not exist. But the advantages must be balanced against the costs. After study, it may be decided that collection agreements should bring together the provinces in three or four sub-sets in which the federal government would not be involved. The bulk of the economies of scale could thus be exploited and the benefits of tax competition reaped.

Whatever is done, it is well to stress that tax competition would not necessarily produce large differences in tax bases and rates. Indeed, to the extent that there are no differences in preferences of citizens and in technologies of production, competition would operate to eliminate differences in tax rates. However, if there are real differences, especially in the preferences of citizens, competition would guarantee that these are not forgotten. Since differences in preferences between provinces are not absolute (see Section II.8), there is a "natural" limit to the extent to which competition would lead to differences in tax bases and rates.

4. The Charter of Rights and Freedoms

Everybody who has made it into the twentieth century and who pronounces on the matter supports rights and freedoms. The issue, if there is one, is not there; it is instead with the notion of a charter that has constitutional strength. The argument is sometimes made that a charter of rights and freedoms encroaches on parliamentary supremacy by allowing the judicial branch of the Government to pass judgement on and to review matters that have been decided by Parliament (as well, of course, as on other matters).

The flavour of the argument that a charter of rights and freedoms is not congruent with parliamentarism resembles, in many ways, the one to the effect that federalism and parliamentarism are not congruent. In fact there is enough resemblance between the two lines of reasoning that one can venture the hypothesis that those who in 1981–82 opposed a charter for Canada, would in 1864–67 have opposed the formation of the Canadian federation.

However that may be, let me ask if a charter and parliamentary institutions really lack congruence. The answer suggested by the theory of competitive federalism is that a charter and parliamentarism are congruent, because a charter makes the whole political system more competitive. It does this by bringing the courts, more especially the Supreme Court, more effectively into the competition that characterizes the political process. First, it sharply increases the competition between the judiciary and the two other branches of government – the executive and the legislative. That, by itself, is a major contribution of the Canadian Charter, for inevitably, over the longer term, the competition will tighten the democratic link between governments and citizens, by giving more importance to citizens, as citizens, in the political process. One implication of this is that the Charter will heighten the degree of competition between the public and the private sectors and to the extent that the latter responds, will truly raise the well-being of Canadians *by increasing market competition.*

It is important to note that the closer government-citizen link that the introduction of the courts in the political process will foster is not limited to the federal government, but will affect all the governments of the federation. To put it differently, the interests of citizens will, henceforth, not be met and served by eleven parliaments only, but also by the courts since citizens will be able to use the courts to be better served by parliaments. Through this second channel, the Charter of Rights and Freedoms will stimulate horizontal competition in the federation. This has already begun: through the courts, interests in one province are challenging rulings and laws in another. That can only serve the public good.

There is a third channel through which the Charter will affect the working of the political process, namely, by strengthening the ability of the Supreme Court to "monitor" vertical competition between the central and the provincial governments. This is achieved through the ability of governments at each level to appeal to the courts if they believe that decisions of governments at one level bias the workings of competition in an unfair and inefficient way. As I have already noted, that role of the courts, and again especially of the Supreme Court, is likely to be considerably larger than it should be unless the Senate is reformed in a way that introduces an effective provincial dimension in the federal Parliament.

The Supreme Court, of course, already "monitors" vertical competition. The reason why that role is likely to grow in the future derives from the fact that with the Charter, the pressure of citizens on their governments will increase and, consequently, governments will vie with each other more aggressively.

To the question of whether the Charter of Rights and Freedoms is a real third pillar of political institutions in Canada, congruent with parliamentarism and federalism, the answer must therefore be a resounding yes. The Charter, by bringing citizens more directly into the political process, increases the degree of competition in the system and, by making "elite accommodation" more difficult, will force the system to be more attentive to the preferences of all citizens.

5. Municipal Governments

Municipalities, as the saying goes, are creatures of provincial governments. This means that the government of a province can unilaterally alter the boundaries of municipal jurisdictions, alter the division of powers between itself and municipalities and overrule decisions made locally in all areas of policy. As time has passed, there has been a tendency for the provinces to consider and to treat municipal governments in many important areas, as *de facto* administrative bodies. It is noteworthy that this has been going on at the same time that provincial politicians, in their dealings with the federal government, were arguing in favour of more decentralization.

Should municipalities be creatures of the provinces, or would Canadians be better off if municipalities were more autonomous decision-making bodies, thus more capable of reflecting the preferences of their citizens and of adjusting to local circumstances? In other words, would the allocation and distribution of resources be more efficient if the municipalities stood *vis-à-vis* the provinces more or less as the latter stand *vis-à-vis* the federal government?

The standard case against an entrenched division of powers between the provinces and the municipalities is that it would lead to a recapitulation at a lower level of the problems encountered at a higher level: on the one hand conflict, rancour and disharmony, and on the other, overlap and duplication. At this point, the reader will not be surprised if, in relation to the first point, I simply say that in my language that means competition, something which, if well "monitored", I hold to be beneficial. With respect to the second point, I simply note that duplication and overlap are, in practice, what competition implies, whether we have market or political competition in mind. The point is readily grasped in the context of competitive markets: how could they be competitive if only one firm supplied a particular product?

The above objection to an entrenched division of powers between provincial and municipal governments is based on a misconception of federalism. Another objection is more simple-minded: it is that provincial governments will be opposed to the idea and consequently that it has no chance of being implemented. The objection is simple-minded because it is obvious that the provinces will be opposed to the notion; no one likes competition when that competition is directed at him or her; no elite with power readily gives it up! One should therefore expect provincial officials to marshal all available arguments – including ridicule – against the idea that if municipal officials were given entrenched powers, the country would be better governed.

Canadians would be better served if municipalities had entrenched powers. Such entrenchments would be provincial-municipal matters. They would be different from province to province. In some cases, a provincial entrenchment law might state that (say) the division of powers between the two orders of government would require some direct participation of municipalities. In other cases, the entrenchment might be more limited, so that changes in the division of powers (say) would be legislated in the provincial legislature, but require a two-thirds majority to pass. Other forms are possible.

No entrenchment can be meaningful unless municipalities are provided with tax bases that can generate revenues capable of matching expenditures. There would, of course, still be "equalization grants" to help "monitor" horizontal intermunicipal competition, but the present total mismatch of revenues and expenditures would have to be corrected.

If one province chose to promote the well-being of its citizens by giving entrenched powers to its municipal governments, it should be aware that the problems that it would face would be no different from those that have to be resolved in federalism as we now know it. In acting as "monitor" of the horizontal competition that would exist between the municipalities, it would have to face the issues of competitive equality, of the appropriability of benefits and costs of local decisions, and others like them. These are not trivial problems, nor are they problems that the highly competent officials now employed at each of the two levels of government – provincial and municipal – could not resolve, if they chose to.

When we come to the matter of "monitoring" vertical competition – that between the provinces and the municipalities – I would suggest that this could be more economically and more effectively done by the federal government than by any other body. That role could be fulfilled by a department, such as the now defunct Department of Urban Affairs, which would develop "municipality-building" policies. The reason for placing the responsibility with respect to vertical competition with the federal government is simply that municipal governments will compete not only with municipalities located in the same province. but with municipalities everywhere in the country. In view of that, it appears difficult to avoid the conclusion that however difficult such a role would be for the central government, no one else can substitute for it.

IV. Conclusion

In the Introduction to this document, I stated my conviction that the mechanisms that discipline democratic politics, especially in federations, are as constraining as the mechanisms that discipline economic behaviour. I trust that the discussion in the two preceding sections, which has outlined a theory of competitive federalism, has gone part of the way in showing that this conviction can be held rationally. I also believe that further developments of the theory of competitive federalism will reinforce the rational basis for such a conviction.

To conclude this already long document, I ask the following question: what does it mean to say that the mechanisms of democratic politics and those of economics are equally constraining? At its most simple, it means that there are, not one, but two broad arenas in which people seek to obtain the things which increase their well-being: markets and governments. Markets, when they are well-structured and competitive, do a good job over the longer term in allocating resources in ways that maximize the well-being of the population. That is a generally accepted proposition and one in which I strongly believe. What is less accepted, but an idea in which I nonetheless believe just as strongly, is that governments, when they are well-structured and competitive, do as good a job as markets, and like them over the longer term, allocate resources in ways that maximize the well-being of people.

I must therefore reject the *a priori* notion that markets are more efficient, more flexible, and more responsive to change than governments. In some circumstances and in the performance of certain tasks, that is certainly the case. However, unless one specifies the circumstances and the tasks – an undertaking which requires the use of comparable theories of politics and of economics as well as solid empirical comparative research – affirmations to the effect that governments are less efficient, less flexible and less capable of responding to change than markets, add up to little less than propaganda.

If comparable[22] markets and governments do equally well, why not suppress one and give all the responsibilities and the kudos to the other? The reason is that they do not weigh the preferences of people in the same way and do not perform the same tasks equally well. There are some jobs which markets do better and others which governments are best at performing, although it is difficult, *a priori*, to sort them out. There is an enormous literature[23] devoted to that question, but it is not, on the whole, a very helpful one.

It is known,[24] however, that to solve this assignment problem on the basis of principles, one must contrast the relative efficiency of governments and markets in the performance of the tasks to be assigned. That is more easily said than done, because as just noted, comparisons must, at the very least, start with two theories, one of politics and one of economics. Furthermore, the two theories must have enough in common to make the comparisons possible and meaningful.

Conventional welfare economics – the most common theory used by economists to address the assignment problem – lacks a theory of politics; instead, it uses the assumption that governments seek the "common good".[25] It therefore "solves" the assignment problem by assumption. Indeed, if governments pursue the common good and if one can demonstrate "market failure", one must conclude that the tasks which markets fail to do perfectly should be assigned to the state. In recent years, a "reverse logic" has been used to generate the opposite conclusion. In that case, the assumption is made that markets always allocate resources efficiently. It then suffices to demonstrate "government failure" to argue that those tasks which governments fail to do perfectly should be assigned to markets.

That reverse logic model also solves the assignment problem by assumption. Why? First, because the work on market "imperfections" – on the increasing returns to scale of many technological processes, on the declining marginal revenue of many business enterprises, on the often less than arm's length relationship in transfer pricing, on the incidence of tie-in sales, on the presence of entry deterring strategies by oligopolists, on the downward stickiness of many prices (including, of course, the price of labour), on price fixing arrangements, on racial, gender and other forms of discrimination, and on other market imperfections – is not usually brought to bear on the matter. Second, because that model also lacks a theory of politics; it demonstrates "government failure" by reference to market mechanisms alone.

The search for a solution to the assignment problem based on first principles is probably beneficial, although that is not certain. My own view of how modern societies work is that the assignment question is "resolved" through competition between governmental and market institutions and that that competition, in turn, is shaped and conditioned by the demands of the public and by the supply of entrepreneurial talent to each sector. Consequently, a growing government sector reflects first the fact that people want not only the things governments supply better, but also those things which governments provide differently than markets, and second, the fact that more aggressive and talented entrepreneurs have found their way in that sector. A declining government sector reflects opposite tendencies. If I am allowed a conjecture, I would suggest that a number of things which are done by governments in Canada could have been done privately, if private sector entrepreneurs had been more imaginative and more aggressive. In that sense, the success of business lobbies in preventing the implementation of an effective competition policy has contributed to the growth of the public sector in Canada.

However that may be, if markets and governments are two competing arenas for meeting the preferences, objectives and desires of people, it is no longer possible to hold to the view, so dear to those who adhere to a Benthamite notion of politics, that all taxes, regulations, subsidies and other forms of intervention by public bodies always cause "distortions".

The notion of distortion is not an easy one to work with. Consider the simplest possible case, that is the case of an economy made up of perfectly competitive neo-classical markets in which the cost of a unit of resources allocated to any use – producing goods and services, moving them around, informing people of their quality, etc. – is exactly equal to the social value of that unit of resources. In such an economy, there are no distortions by construction. The presence of monopolies, pollution, sticky prices, and of taxes, quotas, subsidies, regulations and other public interventions *may*, by introducing a wedge between private and social valuations of resources, create distortions. But they may not. If we acknowledge that governments can influence monopolies, pollution, regulations and taxes, it is essential to know why interventions take place before calling them distortions. It would indeed be a perversion of language to put the name distortion on a deliberately sought policy objective.

An illustration may help. Suppose that the population of a jurisdiction unanimously agrees to ask its government to levy a tax on alcoholic beverages, because, assuming that these are harmful to health, it believes that people could not resist the temptation of drinking more if prices were lower. If the government levies the demanded tax, it would simply be wrong to say that the tax is a distortion; it is an efficient instrument used in the pursuit of a particular objective, which it is hardly the business of analysts or observers to approve or condemn.

The situation would be different if the demand for the tax was not unanimous. Those who found themselves in the minority, unlike the others, would face a distortive tax. It is, therefore, impossible to know if public intervention is distortive or not without a theory of politics. Given that fact, declarations to the effect that the tax system should be neutral, that industrial policy should mimic the market, or that Crown corporations should be privatized, unless they are grounded both in economics and politics, may cause serious distortions, if ever implemented, by preventing the political system from doing its job effectively.

I have run out of time and space and so rest my case. I hope that the theory of competitive federalism which I have suggested above, both as a model of what actually goes on in the Canadian political arena and as a guide to institutional reform, serves as a useful clarification and extension of the discussion of these matters in the Commission's Report and that it helps nourish the public debates which that Report will stimulate.

Notes

1. To these two pillars, a third, in the form of a Charter of Rights and Freedoms, has been added in 1982. I will consider its implications in Section III.
2. J.A. Schumpeter, *Capitalism, Socialism and Democracy* (New York: Harper and Row, 1942, 1975) pp. 84–85.
3. Mainline neo-classical theory is a very large building. There are consequently almost always some more or less obscure rooms in it in which little-talked-about subjects are being worked at. Work on research and development, on innovation and invention, on technical change, and even on the economics of entrepreneurship has been carried out by someone or other at all times. Much of this will surely be re-interpreted and given new life in the light of the recent re-discovery of entrepreneurial competition.
4. I. Kirzner, *Competition and Entrepreneurship* (Chicago: University of Chicago Press, 1973).
5. J.K. Galbraith, *American Capitalism, The Concept of Countervailing Power* (Boston: Houghton Mifflin, Sentry edition, 1962).
6. R.R. Nelson and S.G. Winter, "Simulation of Schumpeterian Competition", *American Economic Review* (February, 1977).
7. D.V. Smiley, *Canada in Question: Federalism in the Eighties*, (Third Edition, Toronto: McGraw-Hill, Ryerson, 1980) p. 91.
8. A research paper done for the Commission also uses that model. See J.A. Brander, "Economic Policy Formation in a Federal State: A Game Theoretic Approach" (1984). Brander rationalizes the use of the prisoner's dilemma model on the basis of what he calls the "public interest" approach to politics. But it is essentially a "collectivist" or "organicist" assumption. See below.
9. R.D. Luce and H. Raiffa, *Games and Decisions* (New York: John Wiley and Sons, 1957), pp. 95. Italics added.
10. J.H. Dales, *Pollution, Property, and Prices* (Toronto: University of Toronto Press, 1968) pp. 58-59. Italics in the original.
11. There is no good word to identify that activity or the role of "monitor". I use this word because it seems to me to be the most neutral. I would take any acceptable synonym as a substitute.
12. *De jure* concurrency is often inevitable. Such cases have led to the development of doctrines such as that of "paramountcy" that help settle the accountability issue.
13. The reader, if he or she desires, can form an impression (but no more) of how I would address the question by referring to A. Breton and A. Scott, *The Economic Constitution of Federal States* (Toronto: University of Toronto Press, 1978) which is largely concerned with that matter, but in a different framework of analysis.
14. Earlier, in condemning the use of the prisoner's dilemma model as a model of federalism, I noted that it was this very same assumption which had led to its adoption. From the point of view of classical political science doctrine, the assumption derives from "organicist", as contrasted to "non-organicist" or "personalist" approaches to behaviour. The lure of organicist assumptions, even on the best minds, is always somewhat of a puzzle to me.
15. A. Hamilton, J. Jay and J. Madison, *The Federalist* (New York: The Modern Library, 1787, 1937).

16. It is possible that the life expectancy of "incumbents" is also increasing in the marketplace.

17. Juvenal's question is: "For who will guard the guards themselves?". Among the more important contemporary students of the question are J. Rawls, *A Theory of Justice*, (Cambridge: Belknap Press, 1971), R. Nozick, *Anarchy, State, and Utopia*, (New York: Basic Books, 1974), and J.M. Buchanan, *The Limits of Liberty: Between Anarchy and Leviathan* (Chicago: University of Chicago Press, 1975).

18. The Americans did not understand that role for the Senate perfectly. They designed a Senate to which Senators were appointed by the States. That proved to be a disaster. Their present elected Senate, giving equal weight to all the states, is as close to the ideal as one can hope to come in designing an efficient "monitor" of vertical competition.

19. A classic exposition of that view is F.R. Scott, "Social Planning and Canadian Federalism" in M. Oliver, ed., *Social Purpose for Canada* (Toronto: University of Toronto Press, 1961). The resistance to federalism is, in effect, a traditional feature of democratic socialism. That case is nowhere better put than in H.J. Laski, "The Obsolescence of Federalism" in A.N. Christensen and E.M. Kirkpatrick, ed., *The People, Politics and Politicians* (New York: Holt, 1941).

20. R.B. Reich, "An Industrial Policy of the Right" *The Public Interest* (fall, 1983).

21. Canada, *Report of the Royal Commission on Dominion-Provincial Relations* (Ottawa: King's Printer, 1940) Book II, p. 84.

22. The kind of problems raised by Mancur Olson in his *The Rise and Decline of Nations* (New Haven: Yale University Press, 1982) can affect markets and governments equally. For that reason, they are neglected in the following discussion. It would be easy to incorporate them in the analysis.

23. I have in mind the literature of welfare economics. At one time, that literature even served as a basis for the formulation of a theory of government. See W.J. Baumol, *Welfare Economics and the Theory of the State* (Cambridge: Harvard University Press, 2nd Edition, 1969).

24. See, for example, G.S. Becker, "Competition and Democracy", *The Journal of Law and Economics* (October 1958).

25. In modern welfare economics, governments are assumed to be maximizing a social welfare function. The "common good" is then defined by choosing a particular degree for the elasticity of substitution among the utilities of persons in society.

E. Gérard Docquier

Preamble

With a view towards contributing to the debate over the economic future of Canada, I wish to submit for the public record a statement on the parts of the Final Report of the Royal Commission on the Economic Union and Development Prospects for Canada with which I dissent.

There are at least four areas with which I cannot agree – some in total and some in part. These are: the lack of a serious effort to eliminate unemployment; the advocacy of U.S.-Canada bilateral free trade; proposals to roll back the Unemployment Insurance Program; and some recommendations on labour-managment relations.

My most fundamental disagreement with the Final Report is over unemployment. Unemployment is the single most important question facing Canadians today. It affects not only how much wealth there is to be distributed amongst society's members, it also reflects itself in the tragic unravelling of our social fabric. The unemployed are not statistics to be manipulated on charts and graphs – they are human beings with faces and personalities with a right to live in dignity, a right they are deprived of today. In this way the Commission has failed the people of Canada.

A Commissioner's Personal Account

In 1982, I was asked to serve on the Royal Commission on the Economic Union and Development Prospects for Canada. Canadians were living through the worst recession since the 1930s. My union, the United Steelworkers of America, the largest private sector union in this country, had 205 000 members in 1979. By mid-1982, that number had dropped to 128 000. I could put names and faces to many of those numbers. The devastation of the recession led me into homes where I found fear, pleas for help, and often-times hunger. I felt at first hand, as an immigrant, as a worker, and as a Quebecer, the personal costs associated with the destruction of our social fabric. Thousands of miners lost their jobs. Permanently. Dozens upon dozens of plants locked their doors. Permanently. Hundreds of thousands were thrown into the streets, losing their jobs and often-times their homes. Families were torn apart. By mid-1982, thousands had exhausted their unemployment insurance benefits. Many of the people I knew and represented were thrown onto the welfare roles. Many lost the means to feed and to house their children.

Canadians have experienced dramatic changes in technological, economic, political and social conditions that have recognizably altered the world in which we live. These changes have been no less fundamental than the Industrial Revolution of the last century. When the Commission was established, there was a need to devote time and resources to finding out what Canadians thought of these changes and how we should respond to achieve the future we wanted.

Canadians have been victimized by a recession over which we have had no control and to which we can see no end. We have undergone a progression of emotions that have ranged from fear and insecurity to anger, and from loss of dignity and humiliation to despair. Our fears have been heightened by watching the rest of the world go through the same agony. We are not alone. We are all helpless. Soup kitchens, food lines, and unions of the unemployed have become daily reminders of the vulnerability of Canadians to severe structural change. And still, permanent jobs are disappearing. Our country, one of the richest in the world, seems incapable of stabilizing the economic and social environment. The human hemorrhage continues.

I was haunted by these concerns because I knew that the changes we were experiencing were more than just the result of a short-term recession. I felt a great deal of uneasiness about participating in such a process. The Canadian Labour Congress and the Government of Canada were at odds on almost every issue that faced the working people of Canada. There was virtually no dialogue on the major issues that confronted the main participants in our society. Nevertheless, I felt that the Commission's mandate was broad enough to encompass the views of those Canadians who are never asked what they think of our economic problems. Their voice needed to be heard in shaping the solutions to our problems. I came to the conclusion that it would be unthinkable not to have the labour movement represented on the Commission. I talked to many people whose advice I respect, first, within my union and, second, within the labour movement. Having received the full support of my membership, and the endorsement of the Canadian Labour Congress, I agreed to sit as a Commissioner.

In many ways, the experiences that have shaped me differ from those that have shaped the rest of the Commissioners with whom I have travelled across this vast country during two complete rounds of hearings. The majority of us, however, did have one thing in common – our concern was for the future, for what the country might become in the 21st century. We may have had differences of opinion, but we all had a sincere and deeply-held respect for the Canadian people.

Statement on the Final Report

Not long after the start of our mandate, it became clear that the work of the Commission would be separated into two tracks. While the Commissioners concerned themselves with the day-to-day experiences of Canadians, the staff of the Commission embarked upon a research program that was noticeably divorced from the realities expressed by those who appeared before us. For the most part, this theoretical research was based on assumptions which I do not support.

The research has exposed for me two views that have been treated as a new orthodoxy: "self-reliance" and "market forces" became the constant litany. I resist the casual adoption of this language because it does not match our reality. This new economic orthodoxy assumes that: we are overly dependent; most unemployment is voluntary; we lack initiative; and that government spending is out of control. Yet, we are the people who work in Faro, on Little Cornwallis Island, in Hibernia and in James Bay. We are the people who have developed the Canadarm. We are the people who gained the attention and respect of the world for the odyssey of one-legged runners.

The Final Report of the Commission states: "We have not come up with a single, simple, compelling message." I clearly heard a single, simple, compelling message: "*Canadians want to work*." While the Report includes rhetoric about the priority of jobs, its research program and recommendations do not reflect a commitment to a full employment economy – a job for everyone who wants one. *Our number one objective is jobs.*

The mandate of the Royal Commission on the Economic Union and Development Prospects for Canada was to report and to recommend to Canadians on their economic future. Instead, it has produced a Report more preoccupied with our past. In many fundamental ways, the Commission's Report has done a great disservice to those Canadians who have shaped our nation. The economic philosophy of the Report is expressed in its Introduction:

> *We seek a new relationship between the political system and the economy and society within which incentives will induce the making of choices compatible with social goals.*

I disagree fundamentally with this principle. Our social goals are clear. They have not changed. Indeed they should not change. Canadians want to work. *Our goal is to create jobs for those that have been deprived of employment.* At the same time, we want to take care of those amongst us who are incapable of caring for themselves. We have long accepted the moral and ethical responsibility to protect those least able to fend for themselves. This is the legacy of the Canadian experience. Our commitment is to full employment and to social justice.

The major concern in the current political environment should be to allocate our financial resources for the attainment of these social goals. *The task of economic management should serve social development.* The biggest single problem which threatens to retard both our economic and our social development is unemployment.

The continuous stream of lay-offs, plant closures and production cutbacks have caused unemployment to increase dramatically. From August 1981 to December 1982, total official unemployment reached 12.9 per cent. The official unemployment rate has been above 10 per cent since May of 1982, and by March of 1985 it remained at 11.2 per cent. When hidden unemployment and underemployment are added, the real level of unemployment is much higher. In March of 1985, Statistics Canada's *Supplementary Survey* showed that at least 270 000 men and women have given up looking for work. They are no longer counted as officially unemployed. Since 1982, approximately 700 000 full-time, permanent jobs have disappeared. Our younger workers, those under the age of 25, are particularly hard hit. By March of 1985, the official jobless rate for our sons and daughters had soared to 17.5 per cent. More than 300 000 jobs have disappeared for this age group alone.

We cannot speak of growth or recovery in an economy where so many of those for whom we have responsibility continue to be jobless. In this society, our self-worth is still largely defined by a job. What will happen to a society where 35-year olds will hold a job for the first time? What will happen to their work habits? What will happen to our work ethic? What will happen to an economy whose spending habits are not driven by the formation of new family units, of productive employees and consumers? How many of we older Canadians will continue to stay in the job market to support our 30-year-old children? Can the word "growth" ever become a positive word to a generation that has no work? How many of us have looked into the eyes of our sons and daughters, our nieces and nephews, our grandchildren, and asked, "What will become of this lost generation?" How can we have a future if we waste it now in joblessness and despair?

For those of us who live in daily contact with the unemployed, the pressures of not being able to affect change have become intolerable. The growth that has been generated by our economy during the last three years is *jobless growth*.

From 1981 to 1983, unemployment has added one million more "new poor" to the ranks of poverty. Poverty is not a rural, regional or "those too lazy to work" problem. Poverty exists from one end of this country to the other. There were 967 000 poor families in 1983 and the majority of those, 557 000, lived in large cities. In poor families, more than one million of our children are being denied a decent upbringing.

Families headed by women have a far higher likelihood of being poor than families headed by men, and the numbers are growing. Of the total number of families headed by women under 65 years of age in 1983, more than 50 per cent were living in poverty, compared to 11 per cent for families headed by men. Close to one-third of all poor families are headed by single-parent women.

To be elderly, a woman and living alone also means to be poor in Canada. Almost 60 per cent of unattached women over 65 years of age are in that desperate situation. It's not much better for men – poverty has claimed 48 per cent of all elderly unattached males. There are 2 500 000 recipients of Old Age Security in Canada. In 1983, 1 500 000 had incomes below $9000.

Poverty includes men and women of all ages, farmers and fishermen, the sick and the disabled, and the unemployed. Contrary to popular belief – large numbers of the "working poor" are men and women with jobs who don't earn enough to escape poverty.

In 1982, well over one-half of the heads of poor families worked, and nearly two-thirds of all poor families had at least one wage-earner. The problem was that they could not get full-time jobs with a decent salary. I am convinced that the only protection these men and women have is the minimum wage law. I fundamentally disagree with the view of the Commission's Report that such laws are simply "rigidities" and insignificant to improving the lot for the working poor.

By February of this year, total employment was back to slightly above the August 1981 level. However, the number of full-time jobs was still 150 000 below the August 1981 level. Permanent full-time jobs have been replaced by part-time jobs of unknown duration and low pay.

In the goods producing industries, close to 500 000 jobs were lost and only 200 000 have been regained. There are still 300 000 fewer jobs in goods producing industries than there were in August 1981.

For youth, there has been no recovery of the jobs lost. By March 1985, employment for workers under 25 years of age was still 300 000 lower than in August of 1981. The youth unemployment rate is 17.5 per cent.

The growth in joblessness of the last two years has occurred despite the strong growth in exports – which grew in volume by nearly 9 per cent in 1983 and by a dramatic 22 per cent in 1984. However, the domestic economy continues to be weak. *Greatly increased trade has not increased our levels of employment.*

I can speak personally of this failure by referring to the changes in composition of the Steelworkers' membership. The changes over the last half decade reveal fundamental structural upheavals. The mining sector, particularly base metals and coal, were among the hardest hit. There has been no recovery. (See Table 1.)

TABLE 1 Mining Membership 1980–84

Sector	Percentage Change
Iron mining	–47.7
Copper	–42.8
Silver	–39.5
Nickel	–44.7
Coal	–33.1

The Canadian steel industry has also undergone significant work force loss. (See Table 2.)

TABLE 2 Steel Industry Membership 1980–84

Sector	Percentage Change
Basic steel and rolling mills	–22.9
Steel wire and nails	–23.6
Pipe and tube	–19.2
Structural fabricators	–31.2

There have also been important membership losses in the metal fabricating sector which consumes the production of the steel industry. (See Table 3.)

Several factors have led to these changes. The recession, new sources of foreign competition for traditional industries, and technological change are all moving us toward a more service-oriented economy. These changes are

TABLE 3 Metal Fabricating Membership 1980–84

Sector	Percentage Change
Iron foundries	−42.0
Steel foundries	−48.0
Hand tools	−40.0
Farm equipment	−53.7

eroding the traditional wage and job structure upon which our patterns of consumption, social opportunity and support have been built. The "middle class", as we have known it, is in danger of disappearing. Incomes are becoming more polarized. We will have even more poor, and more rich, with less and less in between.

In absolute numbers, our Union's membership has gradually returned to 160 000 individuals – the level of the late 1960s. But our new members have come largely from the lower wage service sector. New groups we have organized include security guards, restaurant and rest home workers.

How does the Commission see these problems being resolved? It has adopted a simplistic belief in "free trade" with the United States and with the rest of our trading partners. *This will not solve our unemployment problems.* The last few years have proven it. Nor will we be lifted out of our current and future problems by "getting the incentives right" and relying on the invisible hand of the market.

Real business investment in plant and equipment fell 9 per cent in 1982 and declined by a further 12 per cent in 1983, levelling off in 1984. By the end of last year it was over 20 per cent below the peak reached during the second quarter of 1981. At the same time, tax incentives to corporations, which by 1980 had reduced the federal corporate tax rate to 15 per cent of profits from 36 per cent, have had little effect on stimulating investment and creating growth over the last three years. In the 1950s, corporations paid 58 per cent of federal income taxes while individuals paid 42 per cent. In the 1970s and 1980s, *corporations had their share of federal taxes reduced to under 30 per cent. The share paid by individual taxpayers rose to over 70 per cent. Businesses need customers, not tax incentives.* As long as our industries can satisfy demand for products by operating at three-quarters of capacity, there is no need to expand, to invest or to create jobs.

Tax incentives have not encouraged or resulted in more jobs. For some, tax incentives may have become good politics, but they are not good economics. Indeed, it is this tax structure that is the underlying reason for the problem of underfunding experienced by governments today. Manipulating Canadians' behaviour through the tax system has not been successful. Many of the social objectives that the tax system was designed to achieve have not materialized and the revenue-raising capacity of the tax system has been seriously eroded. I see two reasons for this: slow economic growth and the unfairness of the tax system. The well-advised or the wealthy pay far less than their fair share. Major changes to the tax system are a necessity. Tax reform should begin with the introduction of a minimum tax on high income earners. It is unacceptable to think that in order to have more economic growth we have to create more inequality.

I do not believe that we are over-governed and that the key to renewed growth and prosperity lies in a federal administration that will abandon Canadians to the whims of the market. Among the most forward-looking sections of the Report are those covering social support and human services.

The Report recognizes that:

> *Since the overall level of social policy expenditures in Canada is low by OECD standards, there is no strong general case for attacking the deficit by reducing social expenditures.*

The recommendations propose a package of changes to our income security programs. The Report endorses a guaranteed annual income in the form of a Universal Income Security Program (UISP) as the most appropriate foundation for Canada's income security programs. I welcome this initiative as both a step in the direction of social justice, and a recognition of the importance of social support to our economic vitality.

The Transitional Adjustment Assistance Program (TAAP) would provide adjustment assistance for Canadians who have exhausted their unemployment insurance benefits. Through this program it would also be possible to assist workers to purchase equity in plants, or invest in other forms of community economic development projects. I do not agree with the proposal that funding for the program should be drawn from "savings" from the Unemployment Insurance program.

The proposed Unemployment Insurance "reforms" represent a reduction of benefit levels, and an increase in the qualifying period. This amounts to an outright attack on the unemployed. The victims should not be punished for their plight. The way to reduce the costs of unemployment insurance is to create jobs.

Furthermore, the packaging of the above proposals does not distinguish between income support programs and insurance programs.

Further, the Report identifies occupational health and safety as an area of importance and growing concern. The recommendation calls for:

> *The federal and provincial governments to immediately consider the development of a comprehensive social insurance disability plan to deal with the longer-term effects of occupational health problems, as well as with other forms of disability in the working age population. This plan could be implemented either by expanding worker's compensation into a comprehensive disability scheme or by extending the present disability provision of the Canada and Quebec Pension Plans.*

This too is welcomed as it has long since passed that the needs of the disabled in Canada, regardless of cause of disability, have been met.

With respect to occupational training, increased attention is paid to encouraging on-the-job and job-related training. The recommendations call for a special wage subsidy for labour-force entrants who have not had other forms of vocational training or post-secondary education. In addition, the recommendation is made to provide for a Registered Educational Leave Savings Plan. I disagree with this proposal and would opt instead for a levy-grant system on employers.

Recognizing that our children are the ones who must shape our future, access to higher education for low-income students becomes an area of special concern. The educational system is being starved through lack of funding. Deregulation of the fees structure is no solution.

I agree with the general recommendations on labour-management relations; however, I do so for different reasons and without endorsing all of the findings and comments. Collective bargaining plays a critical role in the distribution of income in this country. It determines, both directly and indirectly, the income of the vast majority of Canadians. I must express reservations about some of the Quality of Working Life experiments that have taken place. Furthermore, I reject the proposal of gain-sharing as a substitute for negotiated wage increases.

The Commission recommends that:

> *Labour relations boards be permitted to create multi-employer and multi-union bargaining units when this is likely to facilitate the bargaining process.*

Our voice was heard in shaping these solutions.

The Report is obsessed with Canada's "competitiveness". There is no doubt that we should strive for economic efficiency. If competitiveness were our only goal, corporations would probably pay no taxes, we would ignore the environmental impact of economic activity and we would abolish social security. None of these objectives are acceptable to Canadians.

The drive for "competitiveness" almost always is an attack on wage levels. The competitive game is a game we cannot win. Someone, somewhere in the world, with enough starvation or repression, will underbid us. It is neither necessary nor desirable to encourage mindless wage-bashing.

The Report describes, sometimes eloquently, the growing phenomenon of global economic interdependence. Interdependence has the potential for developing international solidarity, co-operation and peace. I support the general description of the global environment in the Report, including its human, environmental, economic and political aspects. The danger of workers being pitted against other workers has been dramatically increased as a result of recent monetary and fiscal policies. Canadians have been placed in the position of destructive competition for shares of low-growth markets, made worse by global attacks on current wage levels. These conditions now threaten to destroy the international system of trade and finance established after the Second World War. This system is badly in need of reform. It is especially true, if it is to continue to encourage and assist the development of the countries of the Third World. The collapse of this system would be disastrous. Some of these sentiments are expressed in the Report and I wish to affirm them.

I disagree with the Report on the Third World debt problem. The Third World debt problem has not been resolved. Furthermore, it places insurmountable pressures on fragile economies when they are expected to repay their debts both in the time periods and on the terms being dictated to them. The debt issue is not resolved and the problem will not go away. It also makes other problems worse. Third World producers are dumping goods on the world market as they desperately try to earn foreign currency to pay off interest and debt re-scheduling payments which have continued to mount. This undermines prices and intensifies the global wage squeeze, which in turn generates more and more protectionist pressures, so that the system is brought to the verge of collapse.

The Report makes much of the recent developments in U.S.-Canadian trade. Our increasing dependence on U.S. trade, however, should be seen as a sign of weakness and trouble in our economy, not as a major opportunity for growth. Trade with the Americans must continue. Furthermore, Canada can indeed be seriously harmed by some of the protectionist proposals being put forth in the United States Congress. *An even greater reliance on that imbalanced relationship in the form of a comprehensive Free Trade Agreement is, however, dangerous.* First of all, the current situation is highly artificial. The acceleration of exports to the U.S. in recent years is the combined outcome of a highly over-valued U.S. dollar and continued high real rates of interest in Canada. The spread in interest rates today is as high as it was in August of 1981 when the rate was 23 per cent. As the Americans turn to correct their huge trade deficit, Canada will not escape Congressional notice. Canada is second only to Japan in terms of a trade surplus, and even higher by total volume. The Report recommends addressing this by negotiation of a free trade agreement with the United States. I believe that free trade does not represent a solution to our economic problems. I believe in negotiated trade between nations, within the framework of multilateral agreements. *Unrestricted free trade with the Americans is a blind and imprudent act*, described by some as a necessary leap of faith. Negotiated, secure access to U.S. markets is something I support. However, the terms for access to Canadian markets must include production and employment guarantees, such as were secured in the Auto Pact, and since then embodied in Canadian-content regulations. These are included in the option of "managed trade" which I favour, but which the Report explicitly rejects.

There is an alternative to the free trade option and that is promotion of import substitution and a direct role for government in an industrial strategy. This does not have to mean that a bureaucrat in Ottawa picks the country's economic winners and losers. The Commission recommends free trade as a solution to unemployment and growth. The research work extensively and repeatedly claims that there will be an increase in income and employment as the result of free trade. What all the studies and computer simulations cannot tell us is when these presumed benefits are to flow and to whom:

> *[. . .] in the long run, Canada would benefit substantially from bilateral free trade with the United States, particularly from access to the expanded, unrestricted market and from economies of scale.*

The surge in exports in the last two years has not solved our unemployment problem. Whatever gains may result will be diffuse and longer term, while the pain is immediate and specific. A Camco Steelworker laid off in London asks: what is my future, where is my next job, and what support systems are available to my family?

On stabilization policy and unemployment, the fundamental problem identified by the Report is a highly abstract academic construct called the "NAIRU" (non-accelerating inflation rate of unemployment). This in plain English, is to say that there is a new "natural" rate of unemployent of 6.5–8.0 per cent. *Anything below 6.5 per cent is regarded as voluntary unemployment*. Canadians do not accept this. The unemployment rate of a society is a social and political choice; there is nothing natural about it. The current rate of unemployment of 11.2 per cent is unacceptable to all Canadians. Suggesting that approximately 1 000 000 men and women, 8 per cent of the work force, are "voluntarily" unemployed is ridiculous. Recommending that 1 000 000 Canadians should resign themselves to an unemployed existence is criminal. Endorsement of the NAIRU concept in the Report relegates Canadians to a twenty-first century of underdevelopment.

Finally, as for the Commission's discussions of constitutional matters and its recommendations in this area, I cannot associate myself with its views, nor will I comment on them. Matters in the constitutional arena are in too much of a state of flux in Quebec at this moment in our history to enable me to make any reflections that are of lasting value. Until the Quebec debate over the Constitution is more clearly defined I shall withhold comment.

Lament for a Lost Opportunity

The research work of the Commission and the Final Report have provided the people of Canada and the Government of Canada with no better understanding of the problem or its solutions. Original research on the causes of our unemployment was not undertaken. As a result of its argumentation, the Report leads its uncritical readers to the conclusion that unemployment is not the major problem facing Canadians today, or even if it was, that there is nothing that government can do to resolve it.

Unemployment *is* the major problem facing Canadians today. The gap between the "haves" and the "have-nots" has continued to widen. The recession and the joblessness of many of us has accelerated the process of adding to the ranks of the poor.

The work of the Commission has fallen short of fulfilling its mandate. Many of the serious problems facing the next generation of Canadians remain unanswered or inadequately addressed. The "single, simple, compelling message" expressed by Canadians is reflected in the Papal Encyclical *Laborem Exercens*:

> *Human work is* a key, *probably* the essential key, *to the whole social question. . . .*

The Report has endorsed market based fantasies as a solution to our nearly two million unemployed. Instead, I advocate the continued responsibility of government to manage the economic environment and to encourage new forms of popular participation in public institutions.

John R. Messer

Economic man is an imperfect fiction created by economists. He does not exist as a whole person in real life.

Nor are nations born, nurtured and built as strictly economic entities. Left to economic determinism, it is not likely that Canada would exist today as a relatively independent, sovereign state. The north-south economic advantage would have prevailed, the tenuous east-west ties would have collapsed, and the history of Canada would have been much shorter. That this did not happen was the result of the exercise of political will – of the competition between political and social objectives on the one hand, with economic objectives on the other.

We live very much in a *political* economy; and I, for one, would have it no other way. It is in this context that I record a supplemental view to the Commission's Report. While there are appropriate references to the political role, the Report embraces the currently fashionable economic nostrum which judges market determinations as "good" and government interventions as "bad". In some cases I support the particular judgement. But I do not accept the general proposition that "the best government is the least government".

On this point, I find the arguments of my fellow Commissioner, Dr. Albert Breton, persuasive. I quote from his statement:

> *. . . what does it mean to say that the mechanisms of democratic politics and those of economics are equally constraining? At its most simple, it means that there are, not one, but two broad arenas in which people seek to obtain the things which increase their well-being: markets and governments. Markets, when they are well-structured and competitive, do a good job over the longer term in allocating resources in ways that maximize the well-being of the population. That is a generally accepted proposition and one in which I strongly believe. What is less accepted, but an idea in which I nonetheless believe just as strongly, is that governments, when they are well structured and competitive, do as good a job as markets, and like them over the longer term, allocate resources in ways that maximize the well-being of people.*

With respect to the relationship between the two sectors and the division of roles, Dr. Breton says this:

> *My own view of how modern societies work is that the assignment question is "resolved" through competition between governmental and market institutions and that that competition, in turn, is shaped and conditioned by the demands of the public and by the supply of entrepreneurial talent to each sector. Consequently, a growing government sector reflects first the fact that people want not only the things governments supply better, but also those things which governments provide differently than markets, and second, the fact that more aggressive and talented entrepreneurs have found their way in that sector. A declining government sector reflects opposite tendencies.*

On the whole, Canada has been an economy of markets and governments. Governments have actively intervened in the transportation, resource development, energy and agriculture sectors over time. While every intervention has not always had positive results, we are, in my view, the better economy and the better country on balance.

I would go further. Whatever may be said for the market as the determinant of economic efficiencies, it is a singularly insensitive instrument in measuring social consequences. Not only is it appropriate for government to arbitrate those consequences; to do so is a prime political responsibility. And if, in exercising this responsibility, a government deems it advisable to curb the "freedom" of the market, that too is appropriate. Thus, I find myself at odds with some of the basic underpinnings of the Commission's Report. In no section do I feel more strongly about this than the one which discusses agriculture.

The Family Farm

I find the most logical focus for discussing the agricultural sector to be the primary unit of agricultural production – the family farm. Certainly one must examine markets and marketing, transportation and grain handling, research and development, land use, import replacement and other economic components. But the agricultural sector is more than simply the production, distribution and marketing of food products. As a society, we have a substantial investment in a particular mode of agricultural production: the individually-owned and operated family farm. Unless we are prepared to sacrifice that investment, it behooves us to examine our agricultural and economic policies as they affect the family farm.

There are those that imply that this focus is pure sentimentality. Not true. All that space between Canada's major population centres is not a vacuum. Much of it is filled with farm families and small communities which serve farmers and farm production. When we talk about preserving the family farm, we're talking about preserving jobs, communities, and all the infrastructure of schools, hospitals, power, roads and other services. We are talking about the Wheat Pools, of course, which have served Prairie farmers with such distinction over the past half century. But we are also talking about community co-operatives and credit unions, and small business people, such as farm machinery dealers and other entrepreneurs, who are important participants in the small farming communities across Canada. This is the family farm economy.

It is true that agriculture, in the national context, has shrunk in importance over time relative to other industries. But to say this overlooks its regional importance. In Saskatchewan, which I know best, agriculture is not only the king-pin of the economy, its family-farm base is the core of our way of life for urban as well as rural people. Of course, the family farm is no more a static entity than any other part of our economy. It has changed, and it will change, in response to economic and technological forces. But through all the changes of the past, and with all the changes in farm size, the basic nature of the production unit remains.

For these reasons, I find the discussion of the family farm in the Commission's Report both confused and out of touch with reality. Although many of the economic problems farmers face are the subject of comment, most are dismissed as cyclical problems which farmers have faced before. The question of growing farm size and an accelerated reduction in the number of farmers is disposed of as an economic necessity. I disagree with this view.

To take the Saskatchewan example, a myriad of public programs, federal and provincial, were put in place between 1946 and the present to assist family farmers to be more productive and to reduce costs. They have included the rapid extension of rural power, an improved road network, improved access to credit, farm machinery testing, tax relief, and the Land Bank, to cite only a few. These and other actions, of course, did not halt the process of farm consolidation and the reduction of the farm labour force. But they were public policy responses which improved farm viability and made the adjustment process less damaging to individuals and the community. I would argue, they also slowed the pace and severity of farm consolidation.

If the market is allowed to take its course in current circumstances, the wrong farmers will be lost. The most vulnerable farmers today are not the inefficient, the marginal, the bad managers. They are the young farmers who acquired their land and machinery at high prices, but who are among the most innovative and productive farm managers to be found. If the Report has its way, we would say, "Hands off, market forces are the best arbiter." Then we would lose some of our most productive farmers. True, efficiency will not be served.

The Commission's Report also fails to consider the alternative costs to society of moving, resettling, retraining and finding productive employment for the displaced farmer. Or, alternatively, the social and economic costs of swelling the ranks of the unemployed. Particularly in times like the present, these costs are high indeed.

The Commission's Report also appears to endorse accelerated urbanization. The costs of rural depopulation are not addressed, except to reject the idea that there are any special attributes associated with rural life. But surely these costs are real: in lost employment, lost investment, underutilized infrastructure, and resettlement costs. I would have a difficult time in my native province in dismissing these costs as unsubstantial.

The family farm is in greater jeopardy today than many believe it to be. The recession, present economic trends, high interest rates, the rising cost of inputs and lower product prices have all depressed the farm economy. The natural hazards, regional drought, flooding and pests, have added an additional squeeze. The resulting decline in farm land values has brought many farmers – particularly young and able farmers who entered the industry at the wrong time – close to insolvency.

That many of these events are cyclical, as the Report points out, makes them no less real for the farmers concerned. That the generic family farm has survived down-cycles in the past is also true, but irrelevant. I reject the conclusion that these are persuasive reasons to suggest that governments should simply permit survival to be determined by market forces. Public policy responses to assist with interest rates, loan restructuring and working capital requirements for many of these farmers are both appropriate and necessary.

With respect to the longer term development of the agricultural sector and the family farm, I find myself in full agreement with the Commission's recommendation for greatly expanded research and development. I will comment later on some specific areas which hold promise for the family farm of the future.

I would like now to turn to the Commission Report's discussion of some key areas of agricultural policy which will help shape agricultural production in the future: marketing arrangements, transportation and grain handling, and prices and input costs.

Marketing

The individual farmer and the individual consumer fit well into the classic model of the free market. They each have minimal market power, compete freely with other producers/consumers in selling/buying food products. Unfortunately, other participants in the market fit less well. In transportation, processing and retailing, for example, those standing between the producer and consumer tend to dominate the market.

The historical fact is that the individual agricultural producer in Canada has had virtually no power in the market place. Left exposed, his cash receipts have been the residual sum remaining after processors, commission agents and retailers have taken their share of the end price. It was only through intervention, either through collective action of producers or through public action, that farmers have been able to gain even modest market power. The modesty of that power is clearly demonstrated by the fact that domestic food consumers in Canada enjoy the second lowest food costs, as a percentage of income, in the world. Only in the United States, blessed with a more favourable climate and a much more competitive food processing and retailing environment, do consumers fare better.

Producer marketing boards are a target of the Commission's Report. My argument with the Report is with both what is said and what is not said (or not said clearly enough). The Report correctly distinguishes between institutions which simply provide marketing muscle and expertise for producers of a particular product (for example, the Canadian Wheat Board) and those which, in addition, manage the supply of the product through quotas and other means. Yet, having done so, the Report by implication damns all marketing boards.

What troubles me in the discussions of supply-management marketing boards is the assumption that the other actors in food marketing – processors, wholesalers and retailers – do not engage in practices which affect supply and price. Let me cite two contrary examples in my home province of Saskatchewan.

Saskatoon and Regina are very similar food markets, in both size and location. Yet for several years, the price of a basket of groceries in Regina has consistently cost 10 to 12 per cent more than an identical basket in Saskatoon. The reason: the Regina market is dominated by a single large retailer, while two are battling to dominate Saskatoon. This no doubt benefits Saskatoon consumers in the short run, but when the chains sort out their market share in Saskatoon – as they will – one can be sure that retail margins will rise to or above the Regina level. And because they will have eliminated some of their independent competitors, their market shares will be larger.

In another example, Weston and McGavin recently engaged in a price war in Saskatchewan which saw the price of bread drop below the cost of production. It is doubtful that Weston and McGavin were fighting each other, but rather were attempting to gain market share by forcing independent bakers out of the market.

The point is that these exercises in market power are designed to reduce, not enhance, competition. Furthermore, they demonstrate the power which the independent producer of, say, eggs, milk or poultry faces in marketing his product.

If it is supply management *per se* which the Report finds objectionable, why is there no criticism of supply management which is exercised, not through government intervention but through market domination? The drive to control supply, and therefore maximize prices and profits, is ever-present in our economy. One needs only look at the big three auto manufacturers. If there are too many cars, prices do not fall appreciably; production is cut back.

Similar examples in the food industry are not unknown. One can manage supply in two ways: create a government marketing board which can act on behalf of a number of small firms producing to quota, or reduce the number of firms so that in concert or by tacit agreement they can accomplish the same thing. The latter can happen and does happen. And one device which makes it easier to accomplish is vertical integration.

Having said that, I agree that there are some problems with supply management by boards as currently practiced. Among these, the capitalization of quotas is a major problem. Nevertheless, I cannot agree that all these marketing boards should be scrapped. I support the maintenance of Canadian production, both nationally and regionally. I support the equal opportunity of producers to access markets. I reject the idea that any insurance scheme could provide a satisfactory alternative.

In the larger sense, I find wholly unacceptable the implicit assumption in the Report that managing price and/or supply through economic power in the market place is entirely acceptable (whatever the effect on the consumer), whereas public intervention to provide some balance of market power for the farmer is not.

Grain Handling and Transportation

In its discussion of the Canadian response to export opportunities for grains (essentially, wheat), the Commission's Report deals with three main issues:

- The development and production of varieties other than hard, red spring wheat which will make Canada more competitive in changing world markets
- Inefficiencies in the country elevator system and the associated grain transportation system
- The resolution of the compensation issue pursuant to the abandonment of the Crow rate.

I support the Commission's view with respect to the first; I have reservations and disagreement about the apparent conclusions with respect to the second and the third.

The country elevator system as it has evolved is certainly not above criticism. I share the view that the technology exists which could reduce the historical shrinkage charge to farmers. It should be applied. There may well be changes in the grading system which could improve the efficiency of grain storage and movement.

But the Commission's Report stops there, without comment on the efficiency of railways in serving the country elevator system and the grain producers. The assumption appears to be that the *movement* of grain from shipping point to export position – now that the railways are to receive compensatory rates – will be highly efficient. How is that assumption to be tested? Grain producers and the elevator system have no transport options in Western Canada. There are no inter-modal alternatives. They are captive to a single transportation mode and to two giant, non-competitive rail companies.

Furthermore, one important thrust of these companies in improving their corporate efficiency in grain transport is to *shift* some of their costs onto others. Clearly, their *corporate* efficiency – and the visible costs of the rail transport of grain – will be improved if they move grain from larger, mainline terminals instead of dispersed country elevators.

But, surely, any useful analysis of the system must include *all* the costs, whether borne by the railways directly, or by governments, communities and producers in the form of larger farm trucks, road building and maintenance, fuel, employment, rural community decline, etc.

The Report's broad conclusion that "there is much room for reorganization of the entire system" may be true. But the sketchy and selective evidence considered, combined with the absence of a comprehensive analysis of benefits and costs, robs it of significance.

The failure to consider the key monopoly role of the railways in the system carries over to the Report's consideration of the Crow rate compensation issue. The elimination of the Crow Rate in its present form represents an abrogation of a fundamental historical concession, which farmers had received in return for the costs imposed on them by the other features of the National Policy. If this circumstance is not to be reversed, then the problem is to manage the decision so that the grain producers, and not others, reap the benefits to which they are entitled. That was the deal. And how those benefits are paid is crucial to fulfilling the deal.

The Commisson's view is that freight rates should be fully compensatory. The economic argument as it relates to the primary producer is that this is the only way to remove market distortions which are disadvantageous to livestock production and processing in the Prairies. I will deal with that argument in a moment. First let me deal with one potential result of the Commission's proposal which is totally ignored in the Report: the imposition of grain freight rates which vary on a cost-per-mile basis, or variable freight rates.

If we turn over to the railways the determination of rates, there will be no brake on the railways' ability to reshape the country elevator system and the system of rural communities of which it is a vital part. By offering lower per-mile rates from mainline points – as the CNR is already proposing – the process will be underway, and the shifting of costs will begin. If this reshaping of Western society is to occur, it should be a conscious decision by the people most directly concerned on the farms and in the communities of Western Canada – based on an assessment of *all* the costs – and not left to "market" determination managed by the railways. One great advantage of the statutory Crow rate was that it was neutral in its impact on shipping points except as to distance from export position. This equity cannot be preserved except through performance guarantees attached to compensatory payments by government to the railways, leaving the basic rate structure in position.

The main argument advanced in the Report for full compensatory freight rates – the distortion in location of livestock processing – I find unpersuasive. To give this argument credence, one must assume that:

- There are economic advantages to the producer to be derived from a major shift in the structure of prairie agriculture from grain into livestock.
- There is a market in North America and the world capable of absorbing a substantial increase in red-meat production.

The Report presents no evidence to support either of these assumptions. A study prepared for The Prairie Pools by Arcus Consulting Ltd., however, casts serious doubt on both. Arcus was asked to project, among other things, the impact on the livestock industry of the adoption of a "pay the producers" formula. Among Arcus' key conclusions were the following:

> *Increased livestock output (in Western Canada) is projected under the inelastic domestic grain demand scenario. . . The effect of this increase is a small net gain in livestock gross revenues in Western Canada. . . primarily from changes in the chicken and pork sectors. . . offset in part by a decline in gross revenues of beef producers in the prairie area.*
>
> *Livestock producers in the rest of Canada would suffer a decline in gross revenues in this situation.*

The Prairie Pools conclude that, because of the structure of the North American meat packing industry, it is doubtful there would be greatly increased slaughtering in Western Canada or, indeed, anywhere in Canada.

Citing Agriculture Canada figures, Roy Atkinson pointed out in his submission to the Commission that "beef consumption – on a per capita basis – on the North American continent is now some 20 per cent lower than it was only six or seven years ago." (Roy Atkinson, Brief, November 28, 1983, p.11.)

It is my own conclusion that substantial shifts to greater production and slaughtering of livestock in Western Canada simply would not occur in the short or medium term, and they would not occur at all unless totally unforeseen new markets were found.

Farm Prices and Input Costs

The relationship between farm prices and input costs, currently central to the survival of many family farms, has not received adequate treatment in my view. The facts are, of course, that over time farm prices have been much more cyclical than input costs; that the rising trend lines in input costs has been much steeper than has the trend line in farm prices. When farmers feel and say the problem is getting worse, they are right. The problem is *both* cyclical and secular.

There are perhaps three appropriate responses, one of which is identified in the Commission's Report. Farmers must become even more efficient, changing farm practices, continuing to adopt new technologies, all underpinned by substantial increases in research and development.

A second necessary response, particularly in the short run, is government intervention to reduce current input costs. The costs of fuel, fertilizers, herbicides and operating capital are the most critical. On the Prairies, at least, reductions in the price of farm fuels and lower interest rates for operating loans would seem to be the most practical measures for governments to adopt.

A third possible, if less desirable, response would be government action to support prices. For export commodities like grain, there are many attendant problems in addition to the required expenditure of public funds. But, while I do not recommend this course of action at this time, I would point out that the United States has been heavily involved in support payments to grain farmers for many years, and the European Economic Community even more so. These are our competitors in grain export.

The Commission's Report considers stabilization programs only as a possible substitute for marketing boards, which they are not. A number of stabilization programs are in place in Canada, for example, federally for grain farmers, and in some provinces for pork producers. They are important in the context of dealing with the volatility of prices and production in agriculture, not because they add significant new resources, but because they help even out cash flow. They should be improved and extended to producers of other agricultural products on a federal or federally-approved basis for provinces to administer.

Access to Capital and Intergenerational Land Transfer

The Commission's Report is correct in its conclusion that farmers are disadvantaged in their access to capital under terms appropriate to the risks and variability of cash flow typical of the farm enterprise. It recommends, without being specific, the retention of special credit schemes for agriculture. Presumably this means the Farm Credit Corporation, since the Report suggests that programs such as the Saskatchewan Farm Purchase Program and Ontario's Beginning Farmer Assistance Program have not been effective. No evidence to support the latter judgement is presented.

What is missing here, in light of the current pressures on farmers, is any reference to the need for the restructuring of debt, particularly for those young farmers who entered the industry or expanded at the height of land prices. No special credit programs currently in place fill this need. Nor can we expect it to be filled by commercial credit institutions. Again, I would argue, this is a role for government which is both appropriate and necessary. Action is urgently needed.

On the question of intergenerational land transfer, the Report recognizes the problem, but again, is non-specific in its recommendations. I would place much greater emphasis on the problem than the Report appears to do, particularly because it compounds the already severe capital accumulation problems of a highly capital-intensive industry. To recapitalize the land resource every generation is a very costly and increasingly unworkable way to provide for the retirement of the older generation.

Yet the impetus for farmers to look to land accumulation as the way to provide for retirement is very strong. Existing alternatives are few. The Canada Pension Plan is inadequate, both because of its level and because many farmers would fail to qualify for maximum contributions every year. Retirement Savings Plans look less attractive than land to most farmers because, historically, the appreciation in land values has provided a more attractive return. Nevertheless, better solutions should be sought. The Land Bank alternative, despite the controversy surrounding it, has much to commend it. Perhaps in time it will become more acceptable to the farm community.

I would like to see other, more innovative approaches explored. For example, why not a government-sponsored contributory retirement plan for farmers similar to that available to many employees in the private and public sectors? It would need to be flexible to relate contributions to the variability of farm income. It would need to be locked in to ensure its application to retirement. It would require some measure of matching contributions from government to make it attractive. But, if successful, it could lessen appreciably the farmer's felt need to accumulate land as his only retirement security. This would lessen the pressure on land prices when farm incomes are high. It would permit more flexible arrangements for land transfer on retirement, which could improve the chances of the son or daughter or other young farmer taking over. It would make a direct contribution to maintaining the viability of the family farm.

On these two issues – access to capital and intergenerational land transfer – I agree with most of what the Report says. It simply does not say enough.

The Family Farm of the Future

I have attempted to make a two-part case: first, that any analysis of the Canadian agriculture sector must be sensitive to the continuity of its family-farm base on both economic and social grounds; and, second, that the continuity of the family farm and its rural community base will require much stronger government participation and presence than the Report calls for.

This participation and presence is crucial, whether one looks at maintaining and improving the resource base, developing the needed research and development capability, increasing export opportunities, making marketing agencies more effective (with or without supply management), providing more and better income stabilization programs, or dealing with other cyclical problems which create periodic crises in agriculture.

Given the needed public policy responses, the family farm of the future can make an even greater contribution to higher productivity in agriculture and to rural social and economic development than it has in the past.

In the process, the family farm will assuredly change, and the transition will not always be easy or simple. But those changes will include:

- greater emphasis on the management of the farm enterprise, inluding widespread adoption of management technology
- higher capitalization (although not necessarily in land)
- a more intensified use of the land base
- greater diversification (although not necessarily on individual farm units).

There will be no single model for the family farm in the future, any more than there has been in the past. The nature of the land resource, changing demand, marketing opportunities and other factors will continue to shape individual enterprises. Increasingly, however, entrepeneurship will determine who prospers and who does not. Management skills, informed risk-taking, the adoption of new technology, and adaptation to changing conditions will be key factors.

As more intense cropping practices are adopted (for example, continuous cropping), and as a greater variety of product options becomes feasible through research and market development, the push toward ever greater land accumulation will diminish in many farming areas. Already a number of farmers in the grain belt have concluded that their present land base is sufficient. This trend will become stronger. New techniques and more intensified land use will, however, increase capital requirements, and the availability of debt capital on terms appropriate to the nature of the farm enterprise will continue to be a central need.

Diversification will become much more sophisticated than the traditional mixed-farm model. It is likely to involve greater variety in crops on the one hand, and greater diversity among specialized enterprises on the other. Livestock production in the form of the traditional cow-calf enterprise is likely to give way to more specialized activities geared closely to markets.

There will be fewer farm units, but the pace of consolidation will slow. Rural communities will continue to change, but many will survive and some will grow. And the basic rural social system will continue to serve the farmers and their families in an evolving fashion.

This vision, and all it implies, can be reality if policy-makers in Canada frame their agricultural policies, not on a narrow economic analysis and a commitment to "free market" solution, but on a holistic analysis of social and economic benefits and costs. If they do, the agricultural sector will continue to lead the others in productivity. If they do, the Canadian economy will perform better. If they do, Canada will be a better place for all of us.

Readers will note that I have borrowed heavily from Bruce Scott's chapter in *U.S. Competitiveness in the World Economy*, edited by Bruce Scott and George C. Lodge. The same is true of *The Japanese Industrial System* by Charles I. Macmillan, by far the best and most comprehensive treatment of the Japanese industrial system that I have read. Victor C. Clarke, former Vice-President, Corporate Planning and Development, Canadian General Electric, and Professor Morty Yalovsky of McGill's Faculty of Management will recognize their substantial contribution. I was also very impressed by the paper written for this Commission by Professor Richard Harris of Queen's University, Department of Economics. The errors and misrepresentations are obviously mine.

* * *

Mr. Tomès. Sir, we have reasoned upon your daughter's distemper; and my opinion, as for my part, is that it proceeds from a great heat of blood: so I'd have you bleed her as soon as you can.

Mr. Des Fonandrès. And I say that her distemper is a putrefaction of humours, occasioned by too great a repletion, therefore I'd have you give her an emetic.

Mr. Tomès. I maintain that an emetic will kill her.

Mr. Des Fonandrès. And I, that bleeding will be the death of her.

Mr. Tomès. It belongs to you indeed to set up for a skilful man!

Mr. Des Fonandrès. Yes it does belong to me; and I'll cope with you in all kinds of learning.

Mr. Tomès. Do you remember the man you killed a few days ago?

Mr. Des Fonandrès. Do you remember the lady you sent into the other world three days since.

Mr. Tomès. (To Sganarelle) I have told you my opinion.

Mr. Des Fonandrès. (To Sganarelle) I have told you my thoughts.

Mr. Tomès. If you don't bleed* your daughter out of hand, she is a dead woman.

Mr. Des Fonandrès. If you do bleed her, she'll not be alive a quarter of an hour hence.

Excerpts from *Love's the Best Doctor*, a comedy by Molière. Act II, Scene IV. *Molière's Comedies*, vol. 2 (J.M. Dent & Sons Ltd., London, 1929) pp.63-64.

* * *

This is not a minority report, but a supplementary note. With the give and take usually common in trying to develop a consensual position, I totally support the recommendations of this Report. But given the very broad mandate of this Commission, it was impossible in the main text to express or review some processes of analysis that were too specific. I have decided to write these brief notes on the process of strategy formulation because I was somewhat disturbed by the way the problem of an industrial policy is generally stated and debated publicly.

---

*Read: Cut the deficit.

I believe that the way the debate on that question has developed in the past four years is often futile and dysfunctional. It is too often stated in terms of extreme positions, one being taken by the non-interventionists and the other one by the "picking winners and losers" theorist. This debate, which started in the U.S. a few years ago, has really created an almost irrelevant and misleading forum. I think this has some implications for the interpretation of the recommendations of this Commission concerning an industrial policy for Canada, recommendations which I have already said that I support wholeheartedly. Hence, I should like to comment on the process of that public debate and to initiate what appears to me a necessary review of the structure of the debate itself.

I have divided my notes into four main parts: first, a review of the polarization of the debate on industrial strategy and its misleading consequences; secondly, an overview of the concept of strategy, particularly related to some misconceptions concerning what a strategy is all about; thirdly, a review of the Japanese, the NIC and the near-NIC national strategies; and finally what all this means for Canada.

It all started with a feeling of *déjà vu*. At the very beginning of the public audience-symposium-colloquium process of this Commission and right through to the end, the problem of the Canadian industrial policy has been described in an extremely polarized fashion. One side, which could be described as a Keynesian perspective of what the role of the state should be, was opposed to the Adam Smith view. One can look at it in terms of intervention versus non-intervention or in different terms: that is, in terms of the market as a regulating mechanism as opposed to the government as a regulating mechanism. These positions have been described as if they were opposed, conflictual, contradictory and totally polarized.

The crunch really came for me when, at a symposium in a Canadian university, an economist described his view that the redistribution of income was an inefficient way of managing an economy, and that basically, for every dollar raised through taxation and redistributed, the efficiency was somewhere between 65 per cent and maybe 35 per cent. (I don't remember the exact figure.) This means that of every dollar raised and redistributed, only 35 cents to 65 cents were really efficient; the rest was lost in the cost of distribution.

If that was the case, and given the fact that Western industrialized countries, and specifically Canada, have long since made the decision for redistribution of income so as to attain some degree of equity and fairness, then, I thought, the question became not a question of distribution or no distribution, but more specifically, of studying the process and the mechanics of redistribution of income so as to improve their efficiency.

If the real cost of redistribution is 45 cents or 55 cents or 65 cents per dollar, I thought, maybe there is a way of improving that by 10 per cent, 15 per cent, or 40 per cent. And, I naïvely asked the economist who made the point: "Could you elaborate on that and explain to me how you measure the efficiency of redistribution, and on what basis you come up with figures of that level?" The answer came very fast: "Adam Smith has said all of that 200 years ago." Surely the question was naïve, but the answer was obviously brutally simplistic and ideological.

Despite my obvious lack of training in economics, or maybe thanks to it, it struck me very early in the process of the debate that these were not useful ways of analysing and developing a national strategy. It appeared to me that no more than you can critically evaluate the validity of Euclid, Lobachevsky or Riemann geometries, by staying inside the structure of any of these geometries, you cannot resolve the problem of developing a strategy by staying inside an interventionist or non-interventionist, Keynesian or Smithian theory. These might be useful abstractions to help clarify decision, but one would need something like a metaeconomics science to critically evaluate their usefulness in a given context in the same way that we have to work at the level of a metageometry to review critically and use each geometry in a useful fashion. The debate about the validity of the different geometries raged fifty or sixty years ago, and one philosophy professor told me very simply and very candidly that his unassailable position was that the Euclidian geometry was more perfect than the others because geometry deals with the continuum, and the Euclidian continuum is more homogenous than the Riemann or the Lobachevsky continuum. If Einstein had agreed with that philosopher's view, the theory of relativity would be a museum piece, or maybe it would not exist at all.

All through that debate, as I said, I had that feeling of *déjà vu*. I was wondering "Why? What is the origin of that feeling?" when I suddenly remembered a time long ago, when I was very much interested in the history of Europe and France at the end of the nineteenth century. After the Napoleonic wars, the students and military academics in France debated for thirty years the different merits of the offensive and defensive approach in war, based on the Napoleonic campaigns, and the debate raged with one school of thought claiming that the defensive was the best approach, and another school of thought replying that the offensive was the best defensive.

During that time, the Prussian generals were also laboriously studying the Napoleonic campaigns and were developing a strategy similar to the 1805 strategy of Ulm in the Austerlitz campaign, when Napoleon, scarcely firing a gun, defeated the Austrian army of General Mack. The Prussians developed the Moltke strategy, which they used to encircle and defeat the French army at Sedan in 1870, giving the *coup de grâce* to the Second Empire, without a major battle. I understand that some people still consider this particular debate in the French military academies to be of an extremely high and stimulating intellectual quality. *But what is the bottom line*?

That was the feeling of *déjà vu* that I had when I was hearing the ideological debate raging about the role of the market or the role of the state in developing national strategies. Let me say that ideology or theory are bad advisors in a strategic situation.

There was a parallel debate on the question of whether economics was dependent on political science, as a superseding doctrine, or sociology, or the other way around, but I have always found these discussions fruitless and futile. To develop a national strategy, one has to keep in mind the economic, social, technological, and political dimensions, not one of them superseding the other, but all throwing different lights at different angles on a unique object.

The game, then, is competitiveness, and so let me say a few words about strategy. First of all – and it should be so well known that I wonder why it should be repeated, but it obviously has not been integrated into the thinking of many people who talked to us about strategy – a strategy has a global purpose; *in any implementation of a strategy there are bound to be tactical mistakes.*[1] I have heard it said about the Japanese that they have made a number of mistakes. Their investment in steel twenty years ago is considered a mistake, and that mistake "obviously" disqualified any attempt to develop a national strategy. Even if that was the case, and I pretend that it is not, this would not in any way weaken the role of a strategy in the economic development of Japan.[2]

As I have said, the strategy of Japan, what we could call the "targeting strategy" of Japan, has been an incredible success. To say that some part of it has been a "flop" is not an indication that the strategy itself is not good. One has to look only at the result of the development of the Japanese economy in the last twenty years to see that surely something was done right.

What was the strategy of Japan, broadly defined?

First of all, after the war, Japan became involved in soft industry sectors like textiles and in a lot of cheap imitations. As this approach succeeded, in a second phase the Japanese moved into the heavy-industry sector, investing in shipbuilding, steel, aluminum, cars, etc. As this strategy became very successful also, they moved to a third sector which is the high-technology, high-income/sensitive, high-value/added sector viewed in a global context of international trade. Up to now, therefore, there have been three phases in that strategy.[3]

I need not give details on the results: it is obvious to anybody who reads the newspapers or the economic magazines that this strategy was an incredible success and even one threatening to the Western world. In the development of its strategy, as Japan moved from one phase to the other, it tended to decentralize to other countries, by subcontracting and by making external investments, some elements of the previous phase of its strategy. For instance, as the Japanese were moving into the heavy-industry sector, they started to decentralize towards the NICs part of their light-manufacturing industry. Now, as they move towards high technology, they have been investing in and supporting shipbuilding in Korea, Hong Kong, Singapore, and other areas. Moreover, as these nations are moving into heavy industry, they have started the process of investment and decentralization towards the near-NICs to export the first phase of their industrial development.

This strategy of targeting has been highly successful for Japan, and though it is too early to say, it seems that it is showing substantial success for the Group of Four. Why? Let me use a metaphor to explain. A corporation organized along a divisional structure can have and manage an integrated strategy across its organization, despite the heavy competition among divisions that usually exists in a successful corporation.[4] On the contrary, in a conglomerate, the basic strategy needs to be developed by each of its parts. The divisions or the parts of the conglomerate are so different and so autonomous that each one needs to develop its own strategy, and the strategy of the whole is, in part, derived from the strategies of the parts. To apply that metaphor, Japan is like a divisional organization. It has a homogeneous population, a highly homogeneous and cohesive system of values, an authoritarian political structure, and on top of these, a language and an insular mentality which protects it from the Western world's marketing invasions. It has also developed a deep dedication to the export markets, based on the fear generated by its lack of natural resources, and it enjoys a very large domestic market; these are also elements in its success. This gives the Japanese the chance, despite, or thanks to, the very tough competition existing among industries and among companies, to develop an integrated strategy, managed through a complex structure of consensus development, and to use targeting most successfully.

To define the last phase of their strategy, that is the high-technology, high-income sensitive development that they started 15 years ago, the Japanese did exactly what any firm does: they carried out global market research to find what the growth areas were.[5] The Japanese did this in terms of the global system, that is, in terms of the interdependence and the internationalization of markets; and they chose as a domain to target the income-sensitive product or, in other words, the product for which demand increases strongly with the increase in the global standard of living. That has been their strategy and in that they have been very successful. It is also the strategy that most successful firms follow if the environment permits.

What does this means for Canada and its industrial policy?

I have indicated why it was possible to develop a very coherent strategy of targeting in Japan. That is not possible in the same way in the United States and Canada because of the social, political and legal contexts. The different institutions and the different governments are too autonomous to hope to use a divisional model for developing a strategy. The metaphor applying to Canada and the United States is much more that of the "conglomerate". And a strategy which is possible for Japan or somewhat similar nations like Korea, Singapore or Hong Kong is not a strategy available *in the same way* to Canadians or Americans. Moreover, Canada lacks a very large market to start with.

Consequently, the strategy of choosing "winners" or "losers" or, to express it more accurately, the strategy of targeting, which is available as a strategy for Japan, is not available in the same way for a Canadian or an American political system. We have to find something else.

Because the strategies available to countries like Japan are not applicable *in the same way* in a Canadian or North American context, the temptation has been for many to deny that one of the reasons for Japanese success is their implementation of explicit strategies. That is, again, a futile and possibly a destructive approach. The Americans denied for a long time the possibility of success of guerilla warfare in Vietnam because they were confident in their resource-driven strategy and were not in a position to develop a guerilla strategy. The result is history.

With each increase in international trade – it increased by about 10 per cent last year – the stakes in the export market get higher, the number of players increases, and the competition becomes even fiercer. But most important, Japan and some Asian countries, by questioning the validity of the conventional interpretation of the Ricardian theory of comparative advantage, have shaped a new form of competition and have somewhat reshaped the nature of international trade.

The many recommendations of this Report on free trade, education, the incentive system, macro-economic policy, resource management, and the social support system describe the essentials and form the basis of a strong national strategy for Canada.

Conclusions

Many years ago, Canadian General Electric started a process to study the possibility of moving from a broad product-line base confined to the Canadian market, to a world mandate and a rationalization strategy. I understand that from the time Canadian General Electric decided to look at the possible new strategies and the time they were in a position to start to implement them in the corporation, it took four years. It should not be expected, then, that this Royal Commission could, in a year and a half to two years, define a complete strategy for the country.

Targeting is not an available strategy for Canada today. Too much has still to be understood before we can properly evaluate that option. As indicated in this Report, we should have a tilt towards high technology and export, but stop there for the moment. However, we should remain attentive to any recommendations which could help to reinforce our industrial base. We should constantly remind ourselves that the "targeting" debate is far from being closed at this time, and that strategy formulation and implementation are fundamentally search processes which are in perpetual evolution.

Notes

1. I always remind my students during my course on strategy that to win the Stanley Cup in the National Hockey League, a team has to win four games out of seven, not four out of four. If one were to follow the way that strategy is often evaluated and decide that a strategy is not good because something was lost, because one of the products involved (e.g. the IBM PC Junior computer) has not been a success, it would be tantamount to saying that to really win the championship of the Hockey League, you should not lose one game during the whole season. The IBM PC Junior might have been a bad tactical mistake or might have been mismanaged or might have been a very good decision involving risk, hence the possibility of losing, which is what business and good strategy are all about. It is much too early to say.

2. The English have a very good way of describing that when they talk about someone "who won all the battles but lost the war". Surely if someone "won all the battles but lost the war", the guy on the other side "lost all the battles but won the war".
3. Let me say clearly here that I am not suggesting that the Japanese defined at the start a three-phase strategy. Their strategy did evolve – as does any strategy – as their successes and defeats indicated, and as the world environment changed. Developing a strategy and implementing it are continuous "search processes". Despite the fact that some Japanese policy makers or policy analysts deny that they have looked for high-value/added but concentrated on high-income/sensitive, high-technology products, it is clear that in the long term these products will also be the high-value/added products.
4. See Waterman and Peters *In Search of Excellence*. A highly successful company usually enjoys a fierce internal competition, which is one reason for its success. Again, the debate to try to resolve the conflict between consensus and competition in the Japanese decision-making process is a futile exercise. Consensus and competition are not conflicting, but complementary, elements in a successful system.
5. Again, let me say that I am not pretending that the Japanese "hired a management consultant" and asked for world marketing research. I am really talking about a very large process, not necessarily co-ordinated, involving thousands of people and organizations, which developed into a relatively explicit and precise set of strategies. (see Henry Mintzberg and Alexander McHugh: "Strategy Formation in an Adhocracy", in *Administrative Science Quarlerly*, June 1985. Another reference would be Bourgeois III and Brodwin: "Strategic Implementation: Five Approaches to an Elusive Phenomenon", *Strategic Management Journal*, Vol. 5, 1984, pp. 241–264.)

Jean Casselman-Wadds

It seems to be unanimous that reform of the Senate is desirable. I agree entirely. However, I do not agree that the solution is election of Senators. On the contrary, I fear that this recommendation has only the advantage of being dramatic. Although election of Senators has supporters, in my opinion, not enough thought has been given to their responsibilities after election.

Very little concern has been expressed for the vast increase in election costs. These are already horrendous and, I believe, part of the cause of public disillusionment with governments generally. This disillusionment would increase if election costs doubled and another layer of promises and possible contradictions were presented to voters. If senatorial electioneering were not aggressive and purposeful, it would be disappointing and voters could well be confused as to the purpose.

If elections occurred – either by choice of the Prime Minister or lack of confidence in the government – in close succession, as has happened in the past, senatorial electioneering would either be repetitive or extremely partisan. A Senate overwhelmingly supportive of the party in power would very likely be the result, the very situation which has existed. Political patronage might well increase, leading to still further discontent with government.

Unless the responsibilities were increased and clarified, the behaviour of the Senate might remain the same, unless the desire for re-election created a demand for more responsibility and power. In this case, governments would be involved in time-consuming reforms of the Constitution. This would distract from concentration on governing and attention to the immediate economic and social problems. Again, this is the very situation we wish to correct.

Election of the Senate would require such planning and negotiating that even its most enthusiastic supporters admit that it is a solution for the distant future. We have examples from other countries that going through the election process in itself does not guarantee high calibre of participation.

I would prefer laying this recommendation aside and concentrating on what would seem to me to have more immediate prospects of results. Since better co-ordination in the workings of provincial and federal governments seems to be another unanimous goal, I would prefer a broader-based system of appointments to the Senate which would include recommendations from a variety of sources, including provincial governments. Coupled with this, I would recommend mandatory attendance, with replacement automatic after a stated period. In the past, Senate Committees have done very worthwhile work, not always fully recognized and appreciated. These should be given more responsibility and more prominence.

I believe our system of appointment still has merit, and itself could be reformed quickly! I believe the Prime Minister should be supported by a Senate Appointment Advisory Council. The Council would draw up lists of meritorious candidates by province and pay particular attention to a variety of socio-economic considerations to ensure a broadly representative set of candidates. Appointments based on recommendations from a broader process would likely be of more local origin and could overcome some of the isolation felt by certain regions and socio-economic interests. The Prime Minister would appoint the Council, in consultation with the Official Leader of the Opposition, at the outset of the government's mandate. The Prime Minister would not be restricted to the nominations list but would be guided by it.

It is quite clear that the Senate should be reformed. I believe that the incremental steps I am proposing are in the right direction and have the benefit of being practical. Other reforms would likely evolve once a real determination is shown to recognize the Senate's potential contribution to Canadian society. If it is important, let us do it now.

APPENDIX A

Orders in Council and Exchange of Letters with the Prime Minister

P.C. 1982-3438

CANADA

PRIVY COUNCIL

Certified to be a true copy of a Minute of a Meeting of the Committee of the Privy Council, approved by Her Excellency the Governor General on the 5 November, 1982

The Committee of the Privy Council have before them a report from the Prime Minister, the Right Honourable Pierre Elliott Trudeau, submitting:

> That Canada is a country of tremendous opportunity, committed to the sustained economic and social progress of its people, to the reduction of economic and fiscal disparities between regions, and to a fair distribution of the advantages and burdens of national development;
>
> That significant changes are occurring in the world economy, particularly in the sphere of industrial activity, the utilization of natural resources and movement of capital within and among countries, changes which will have important consequences for Canada;
>
> That existing economic relationships among countries and among individuals and groups within countries are characterized on the one hand by increasing interdependence and at the same time by intensified competition;
>
> That to respond to the challenges of rapid national and international change in order to realize Canada's potential and to secure sustained economic and social progress, it will be of importance to achieve greater understanding of the aspirations of the regions of Canada, greater co-ordination between actions of governments in Canada and greater support for the Canadian economic union.

Therefore, the Committee of the Privy Council, on the recommendation of the Prime Minister, advise that the Honourable Donald Stovel Macdonald together with such other persons as may be named from time to time be appointed Commissioners under Part I of the Inquiries

Act to inquire into and report upon the long-term economic potential, prospects and challenges facing the Canadian federation and its respective regions, as well as the implications that such prospects and challenges have for Canada's economic and governmental institutions and for the management of Canada's economic affairs.

The Committee further advise that the study include an examination of and a report on:

(a) the appropriate national goals and policies for economic development, including consideration of the following:

- trends in labour market requirements and conditions;
- developments in the supply of raw materials, including energy sources;
- capital requirements and the cost structure in a highly competitive, technologically-sophisticated and interdependent world environment;
- trends in productivity, standards of living and social progress;
- industrial adjustment and growth;
- regional economic development opportunities and constraints in a national economic framework;
- the integrity of the Canadian economic union as it relates to the unity of Canada and the ability of all Canadians to participate in increased economic prosperity;

(b) the appropriate institutional and constitutional arrangements to promote the liberty and well-being of individual Canadians and the maintenance of a strong and competitive economy including consideration of the following:

- means for improving relations between governments, business, labour and other groups in Canadians society;

...3

- the appropriate allocation of fiscal and economic powers, instruments and resources as between the different levels of governments and administrations;
- changes in the institutions of national government so as to take better account of the views and needs of all Canadians and regions, and to encourage the further development of the Canadian economic union.

The Committee also advise that in pursuing such inquiry and preparing the report, the Commissioners proceed by reference to the following principles:

(a) the Canadian economy is founded on the enterprise and productivity of individual Canadians supported by a unique mixture of public and private sector activity that reflects the traditional values of Canadian society;

(b) Canadian economic policy must be assessed in the context of its relationships to Canadian political and economic independence and to the broader aspirations of Canadians as must be reflected in the responsibilities of governments;

(c) the Government of Canada has the primary responsibility for managing the national economy, for encouraging reasonably balanced economic growth among the various regions of the country and for ensuring that fiscal disparities among provinces are reduced, while at the same time the provincial governments also have important responsibilities in the development and carrying out of economic and social policy;

(d) the report should take account of, and respect, the spirit of the Constitution of Canada and assume a continuing Canadian federal structure not significantly different from its present form.

The Committee also advise that the Commissioners:

...4

1. be directed, within the ambit of their work, to seek the views of all provincial and territorial governments as well as interested Canadians from all walks of life and all regions of the country;

2. be authorized to establish such advisory bodies of prominent Canadians as they deem desirable to assist them in the examination of any aspect of their terms of reference;

3. be authorized to adopt such procedure and methods as they deem appropriate for the proper conduct of the inquiry;

4. be assisted by the officers and employees of the departments and agencies of the Government of Canada as may be required for the conduct of the inquiry, particularly in having access to written material;

5. be authorized to sit at such times and in such places in Canada as may be required;

6. be authorized to exercise all of the powers conferred upon them by section 11 of the Inquiries Act;

7. be authorized to engage the services of such staff and technical advisers, including counsel, as they consider necessary or advisable to aid them in the conduct of the inquiry at rates of remuneration and reimbursement as may be approved by Treasury Board;

8. be authorized to rent office space and facilities for public hearings in co-operation with the federal Department of Public Works as they may deem necessary at such rental rates as are consistent with the policies of the Department of Public Works;

9. be authorized to publish special studies as may be appropriate from time to time;

10. be directed to submit their report to the Governor in Council with all reasonable dispatch but no more than three years from now;

...5

11. be directed to file with the Dominion Archivist the records of the inquiry as soon as reasonably may be after the conclusion of the inquiry.

The Committee further advise that the Honourable Donald Stovel Macdonald be the Chairman of the Commission.

Cabinet du Premier ministre

Release

Date: November 5, 1982

For release: Immediate

The Prime Minister announced today that the government has appointed The Honourable Donald S. Macdonald chairman of a Royal Commission on the Economic Union and Development Prospects for Canada.

The terms of reference are "perhaps the most important and far-reaching that have ever been assigned to any Commission in our history," he said.

The Prime Minister said that while short-term action is necessary to counter the adverse effects of the recession and lay the groundwork for the return to prosperity,"we must look further ahead to see in what ways the country and its institutions might change to take full advantage of future opportunities for development.

"We now live in a much more competitive, technologically-sophisticated and interdependent world environment," the Prime Minister said. "It is time we stood back to look at all these changes and, in the light of what has happened, to look ahead at what the next generation of development can bring -- if we do things right."

Moreover, the Prime Minister emphasized the need for Canadian institutions to keep up with a rapidly changing environment.

.../2

Canada

"If we are to prosper," he said, "we must find ways to lessen the clamour of federal-provincial argument, and to reach consensus with far less pain. But if this is to be achieved, we must ensure that national policies are designed so that all parts of Canada can benefit from them, and that national institutions are truly reflective of regional needs."

The Royal Commission is being asked to:

- assess Canada's economic potential over the longer-term;
- recommend national economic goals, and national policies for the attainment of those goals;
- recommend ways in which the institutions of the national government -- particularly those institutions which are vital to economic development -- can better reflect the views of all Canadians and regions;
- recommend institutional arrangements to handle more effectively relations between governments, business and labour, and the fiscal and economic aspects of federal-provincial relations.

The Prime Minister stressed the wide scope of the work assigned to the Royal Commission, the broadly representative and diverse nature of its membership, and the likelihood that its recommendations will contribute significantly to a brighter economic future for Canada. He expressed the hope that support for its establishment and cooperation with its work as it proceeds, will come from the House of Commons, all government and legislative organizations in Canada and from Canadians everywhere.

Royal Commission on the
Economic Union and
Development Prospects
for Canada

Commission royale sur
l'union économique et les
perspectives de développement
du Canada

September 7, 1984

Dear Mr. Mulroney:

My first words are those of congratulations on an historic electoral success. I know that in taking on these heavy responsibilities of forming a new government you will be reviewing a number of ongoing activities and assessing options and I felt that it would be appropriate to offer to you and to the Clerk of the Privy Council a current report on the work of the Royal Commission.

My fellow Commissioners and I are at the stage where we are drawing together almost two years of preparatory work involving the largest consultative and research effort in Canadian history. While our mandate requires us to report by November 5, 1985, I have prepared a course which would complete a final report well before that date.

The Commission budget is $21.7 million. We have completed the bulk of our work at a cost of $16.3 million in actual and committed funds. I would hope that we can conclude our task at a total cost of under $20 million overall.

I have provided the Clerk of the Privy Council with a status report on our activities which I have enclosed. Should you or your officials wish further information or to meet with Commissioners or senior staff we would be very pleased to do so.

Yours sincerely,

Donald S. Macdonald

Hon. Donald S. Macdonald
Chairman

The Honourable Brian Mulroney
Prime Minister Elect
Room 627, Wellington Building
House of Commons
Ottawa, Ontario

P.O. Box/CP 1288
Ottawa, Canada
K1P 5R3

Canadä

CANADA

PRIME MINISTER • PREMIER MINISTRE

Ottawa, K1A 0A2
November 2, 1984

Dear Mr. Macdonald:

I was pleased to learn that you and the Minister of Finance, the Honourable Michael Wilson, have had the opportunity of reviewing together the work of the Royal Commission on the Economic Union and Development Prospects for Canada.

Pursuant to that meeting, I wish to confirm the Government's views on how the Commission should complete its mandate.

You are no doubt aware that the effective resolution of the economic problems currently besetting Canada constitutes the priority for the Government: how to reduce deficits while remaining sensitive to the needs of Canadians, how to stimulate the entrepreneurial capabilities of Canadians, how to expand our markets abroad, how to attain optimum levels of employment in all regions of the country, and how to ensure that the talents of young Canadians are put to effective and productive use. The Government, therefore, will be particularly interested in the Commission's proposals respecting these matters.

The Honourable Donald S. Macdonald,
Chairman,
Royal Commission on the Economic Union
and Development Prospects for Canada,
151 Sparks Street,
Ottawa, Ontario.
K1P 5R3

I understand that it is the Commission's intention to present its final report in June of 1985 or soon thereafter, and it is the Government's hope that this goal will be met. The Government likewise hopes the Commission will complete the publication of pertinent research papers no later than November 5, 1985. I was also informed that you plan to hold the Commission's total expenditures at about $20,000,000 and wish to convey the Government's hope that you will be able to achieve this target, and thus stay well within the three-year budget of $21,790,000 initially proposed.

It is my intention to make this letter public so that Canadians may be informed of the Government's views on the work of the Commission.

Please accept my best wishes as you endeavour to complete your work in a timely fashion, within budget and with a focus on Canada's pressing economic problems.

Yours sincerely,

F. Dwayne Wright, Business Council on National Issues	Day 1
Jean Wright, Economic Policy Researcher, Canadian Federation of Students	Day 1

APPENDIX D

The Collected Research Studies

The studies listed below were prepared as background papers for the Royal Commission on the Economic Union and Development Prospects for Canada. Although written under the auspices of the Commission, the views expressed and the conclusions and recommendations contained in the studies are solely those of the authors and do not imply endorsement by the Chairman and Commissioners. At the time of writing, a few of the studies listed have not yet been completed or approved.

The studies have been grouped in volumes (also identified below) and, in cooperation with the Royal Commission, are being published in English by the University of Toronto Press, and in French by the Canadian Government Publishing Centre (Supply and Services).

The research program of the Commission was carried out under the direction of Ivan Bernier (Law and Constitutional Issues); Alan Cairns (Politics and Institutions of Government); and David C. Smith (Economics). Kenneth Norrie and John Sargent acted as co-directors of research for the concluding phase of the Economics program.

Economics

François Vaillancourt
Research Co-ordinator, Income Distribution and Economic Security, Volume 1

VOLUME 1: INCOME DISTRIBUTION AND ECONOMIC SECURITY IN CANADA

François Vaillancourt	Income Distribution and Economic Security in Canada: An Overview
Mireille Ethier	The Underground Economy: A Review of the Economic Literature and New Estimates for Canada
B.G. Dahlby	The Incidence of Government Expenditures and Taxes in Canada: A Survey
Bernard Fortin	Income Security in Canada
Jean-Michel Cousineau	Unemployment Insurance and Labour Market Adjustments
Mireille Ethier	Survey of Pension Issues
Gilles Grenier	Health Care Costs in Canada: Past and Future Trends
Jonathan R. Kesselman	Comprehensive Income Security for Canadian Workers

Donald G. McFetridge
Research Co-ordinator, Industrial Structure, Volumes 2-8

VOLUME 2: CANADIAN INDUSTRY IN TRANSITION

Donald D. McFetridge	The Economics of Industrial Structure: An Overview
Michael Charette, Robert R. Henry and Barry Kaufman	The Evolution of the Canadian Industrial Structure: An International Perspective
R.S. Khemani	Extent and Evolution of Competition in the Canadian Economy
E. Craig Elford and William T. Stanbury	Mixed Enterprises in Canada
John R. Baldwin and Paul K. Gorecki, with J. McVey	Canada-U.S. Productivity Differences in the Manufacturing Sector: 1970–1979
Donald J. Daly	Rationalization and Specialization in Canadian Manufacturing
Paul M. Bishop and Harold Crookell	Specialization and Foreign Investment in Canada

VOLUME 3: TECHNOLOGICAL CHANGE IN CANADIAN INDUSTRY

Jeffrey J. Bernstein	Research and Development, Patents, and Grant and Tax Policies in Canada
Ned Ellis and David Waite	Canadian Technological Output in a World Context
Edwin Mansfield	Technological Change and the International Diffusion of Technology: A Survey
Donald J. Lecraw	Corporate Operation and Strategy in a Changing World Environment
Donald G. McFetridge and R. J. Corvari	Technology Diffusion: A Survey of Canadian Evidence and the Public Policy Issues
Isaiah A. Litvak and Christopher J. Maule	The Canadian Aluminum and Steel Industries

VOLUME 4: CANADIAN INDUSTRIAL POLICY IN ACTION

Donald G. McFetridge	The Economics of Industrial Policy: An Overview
Harold Crookell	The Impact of Government Intervention on the Major Appliance Industry in Canada
Sandford F. Borins and B. Boothman	Crown Corporations and Economic Efficiency
John Chant	An Agenda for Research on Financial Markets

Keith Acheson	Economic Regulation in Canada: A Survey
Donald G. McFetridge	Commercial and Political Efficiency: A Comparison of Government, Mixed and Private Enterprises

VOLUME 5: ECONOMICS OF INDUSTRIAL POLICY AND STRATEGY

Donald J. Lecraw	Industrial Policy in the United States: A Survey
Reuven Brenner and Léon Courville	Industrial Strategy: Inferring What It Really Is
Marsha Chandler and Michael J. Trebilcock	A Comparative Survey of Industrial Policies in Selected OECD Countries

VOLUME 6: THE ROLE OF SCALE IN CANADA-U.S. PRODUCTIVITY DIFFERENCES

John R. Baldwin and Paul K. Gorecki	Canada-U.S. Productivity Differences in the Manufacturing Sector 1970-1979

VOLUME 7: COMPETITION POLICY AND VERTICAL EXCHANGE

F. Mathewson and R. Winter	Competition Policy and the Nature of Vertical Exchange

VOLUME 8: THE POLITICAL ECONOMY OF ECONOMIC ADJUSTMENT

Michael J. Trebilcock	The Political Economy of Economic Adjustment: The Case of Declining Sectors

John Whalley
Research Co-ordinator, International Trade, Volumes 9-14

VOLUME 9: CANADIAN TRADE POLICIES AND THE WORLD ECONOMY

John Whalley (in collaboration with Colleen Hamilton and Roderick Hill)	Canadian Trade Policies and the World Economy

VOLUME 10: CANADA AND THE MULTILATERAL TRADING SYSTEM

John Whalley	Canada and the Multilateral Trading System: An Introduction
Colleen Hamilton and John Whalley	The GATT and Canadian Interests: Summary of the Proceedings of a Research Symposium
Rodney de C. Grey	The Service Industries: A Note of Caution about the Proposal to Negotiate Rules About Traded Services
